Space Situational Awareness - Virtual Search Environment

Tuesday, 15 October 2019 12:40 (20 minutes)

Mr Marek Kubel-Grabau

Analytic at EVERSIS sp z.o.o.

EVERSIS created a prototype web platform called the SSA-VRE (Space Situational Awareness - Virtual Search Environment) which aims to provide domain specialists with a space where science solutions and tools could be made available for scientific audiences, supported by possible ideas exchange and community building.

The SSA-VRE organically grows and expands the possibilities of using the data that fosters innovation and results in world-leading collaborative solutions. It supports across segmental cooperation of dozens of scientists and service providers. A platform is packed not only with data and tools but also inspiring remarks, knowledge resources to browse and share, or projects everyone can join and develop.

Eversis team would like to discuss the concept of science community building and information flow in the open-sources digital environments. Team will try to answer a question why such an idea is successful in the SSA domain and how it could benefit other science domains
