

# An automatic system for flood mapping based on Sentinel-1 data

**Elisabetta Fiori**<sup>1</sup>, Luca Pulvirenti<sup>1</sup>, Giuseppe Squicciarino<sup>1</sup>,  
Silvia Puca<sup>2</sup>

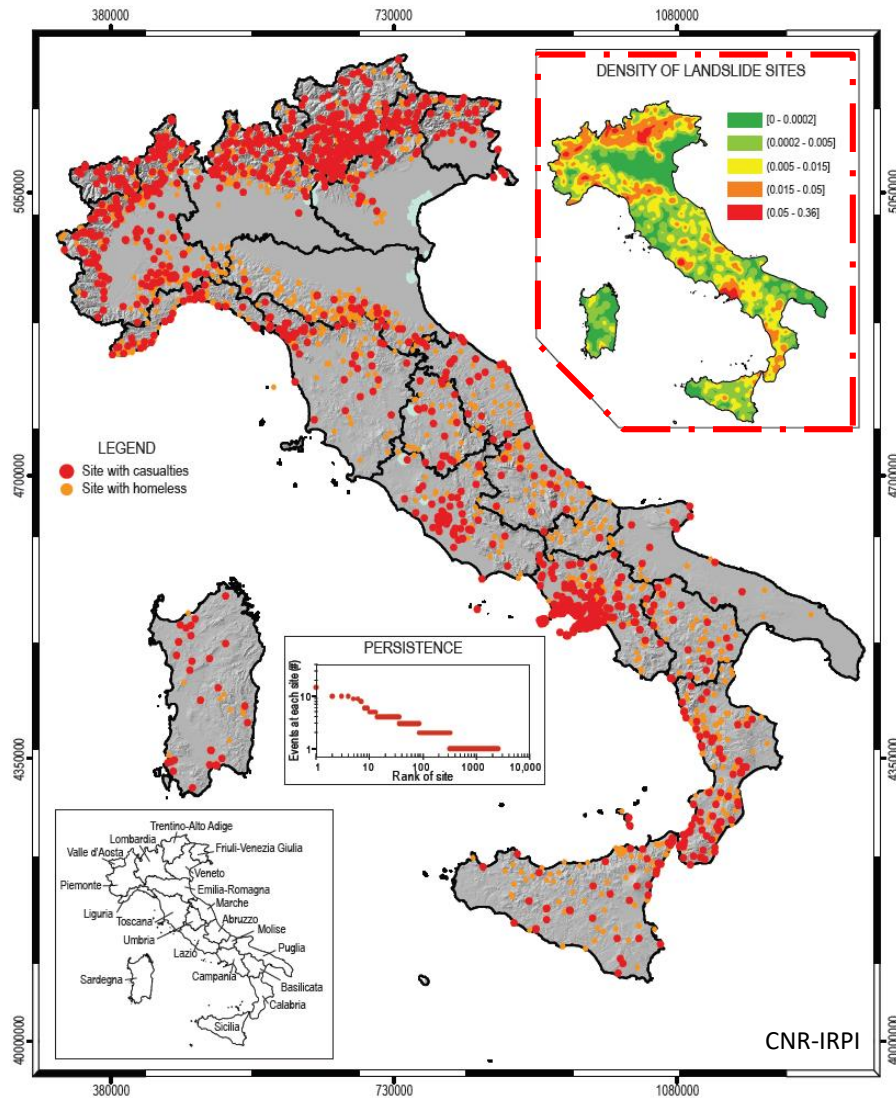

<sup>1</sup> CIMA Research Foundation, Savona Italy

<sup>2</sup> Italian Department of Civil Protection, Presidency of the Council of Ministers, Rome, Italy

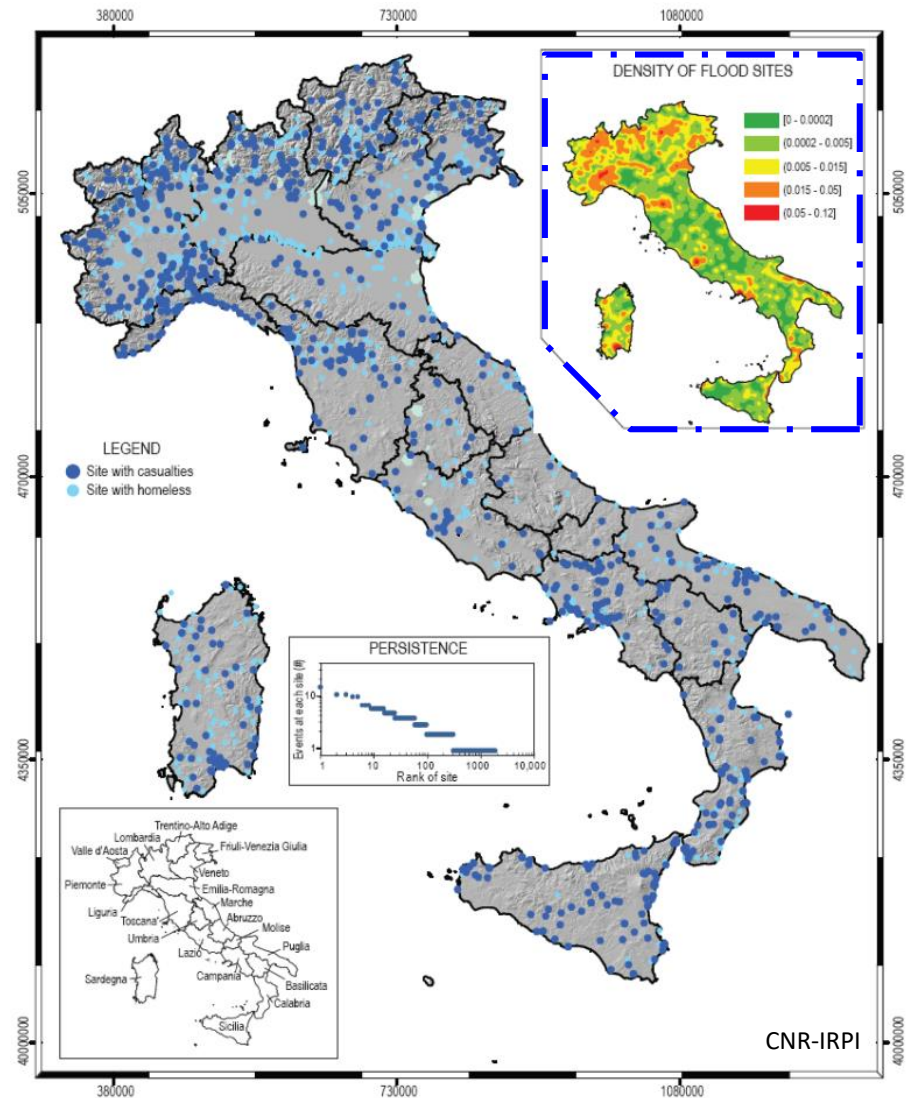

# Introduction

- An automatic system for water detection (AUTOWADE) based on S1 data was designed to provide the Italian Dept. of Civil Protection (DCP) with NRT information on the status of permanent water and floodwater
- SAR is the most useful EO instrument for flood mapping
  - ability to distinguish between land and water
  - all-weather & day-and-night images with high spatial resolution
- State of the art algorithms for automatically mapping the extent of a flood using SAR now mature for operational implementation
- Present availability of *6-days repeat Sentinel-1 (S1)* SAR data represents a big opportunity to design a tool that systematically produces water maps at a *resolution of 20 m*

# Hydraulic and hydrogeological risk in Italy

Location of 2533 sites affected by landslide events with direct consequences to the population. Period 650-2008

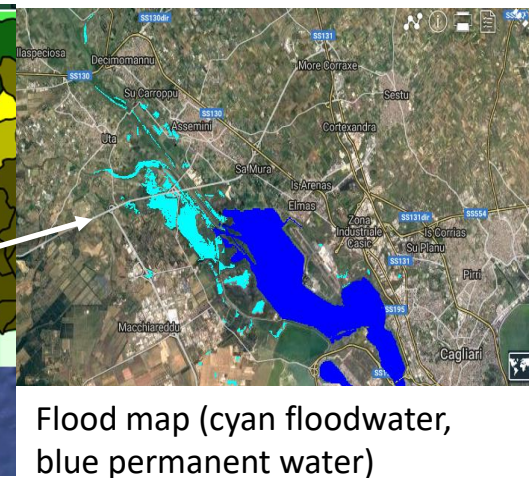

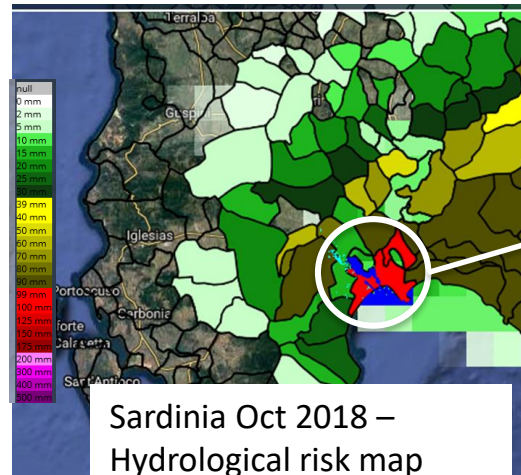

Location of 1836 sites affected by floods events with direct consequences to the population. Period 590-2008

# Motivation

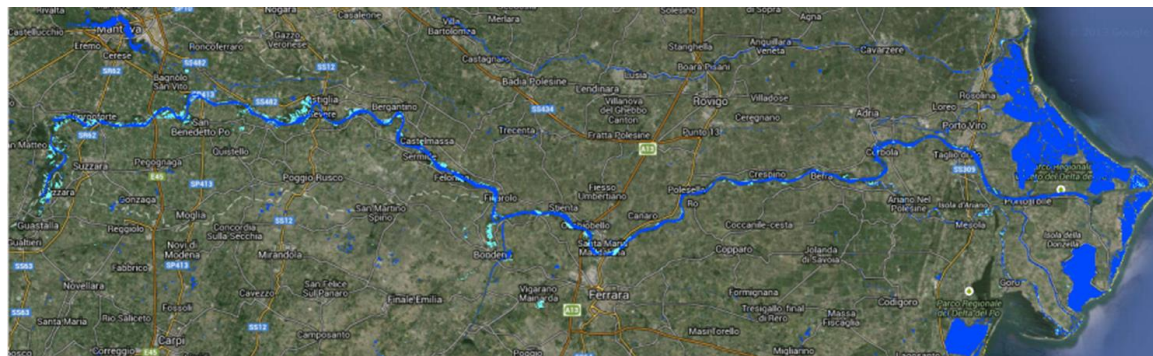

- NRT data about the extent of **floodwater** useful to:

- ✓ Provide information on the situation in areas where hydrological alerts are issued
- ✓ Manage fast-moving events
- ✓ Identify high priority areas

- NRT data about the extent of **permanent water bodies** useful to:

- ✓ Monitor water resources in areas affected by droughts
- ✓ Monitor swollen rivers →

Po River – Nov. 2014

# Fully automatic system: pros & cons

- Pros

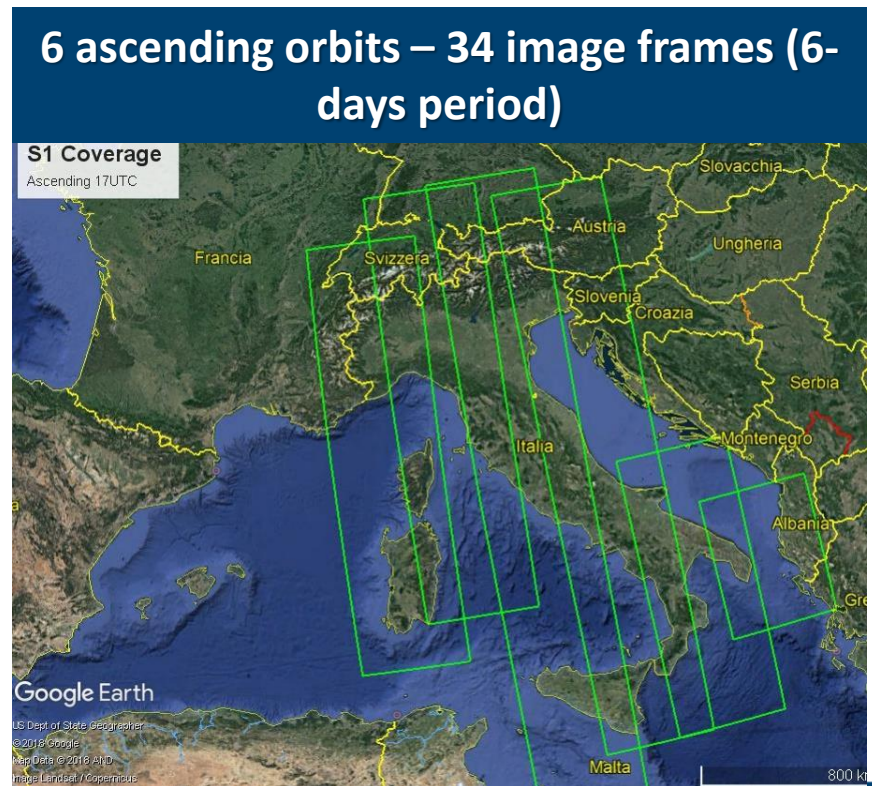

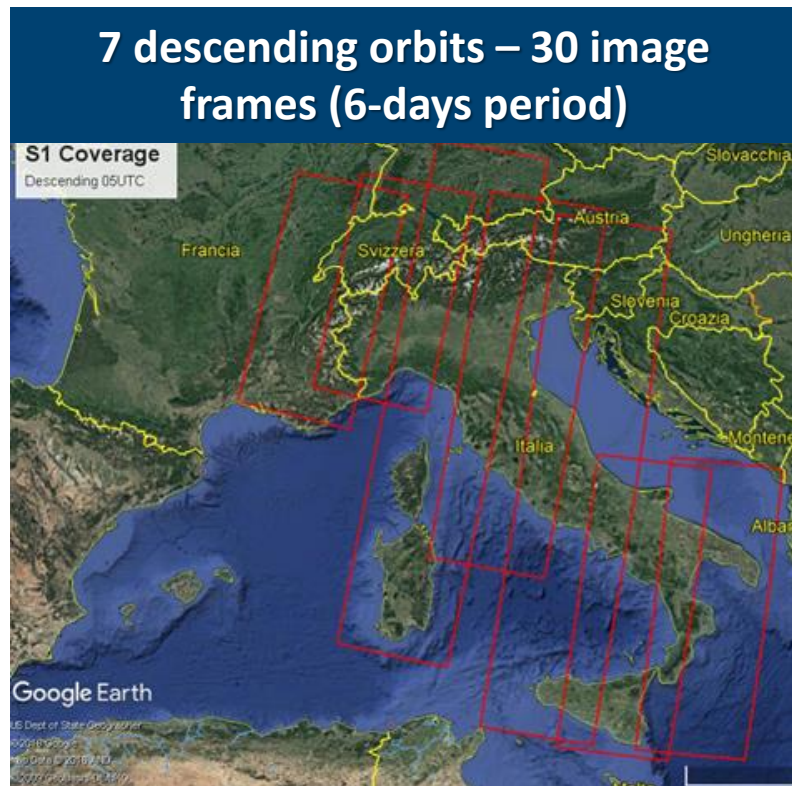

- Water mapping processor complemented by download of SAR data and delivery of the result to the end-user
  - no user input needed for SAR data collecting & pre-processing
- No need of an explicit activation from authorities
- Objectivity and traceability of the water mapping process
  - Result does not depend on the subjective interpretation of the operator

- Cons

- Supervision from skilled operators may produce a more accurate result

# Sentinel-1 orbits over Italy

- Sentinel-1 (A & B) images of a given location available **every 6 days** (same configuration of measurement) with both morning and evening overpasses
- Ground Range Detected (**GRD**) products used by the proposed system

# Automatic Sentinel-1 GRD data procurement chain

- Copernicus Open Access Hub automatically queried to verify the availability of new GRD products
- As soon as new products are available (by default after 4-8 h) they are downloaded and then calibrated and geocoded

The screenshot displays the Copernicus Open Access Hub search results page. The top navigation bar includes the ESA and Copernicus logos. A search bar at the top left contains the text "Insert search criteria...". Below the search bar, a list of 12 products is shown, ordered by ingestion date. The first product is highlighted, showing its details: "Request Done: ( footprint: 'Intersects(POLYGON((11.743551492240297 37.619643575477895, 14.277874154699454 37.619643575477895, 14.277874154699454 45.43378371246877, 11.743551492240297 45.43378371246877, 11.743551492240297 37.619643575477895)))' ) AND ( ingestionDate:[2019-11-17T00:00:00.000Z TO 2019-11-17T23:59:59.999Z] )". The product details include the ID "S1B\_IW\_GRDH\_1SDV\_20191117T165802\_20191117T165827\_018970\_023C98\_6CFA", the download URL, the mission "Sentinel-1", the instrument "SAR-C", the sensing date "2019-11-17T16:58:02.683Z", and the size "1.66 GB". A map of Europe is shown in the background, with a red rectangle highlighting the area of interest in the southern part of the continent.

# Water bodies detection using SAR

- Smooth water surfaces *specularly reflect* the radar signal
- A specular surface has a low radar return (lower than the return from the surrounding land surfaces)
- In a SAR image, water bodies (including flooded areas) generally appear *darker* than the surrounding areas.

- *Exceptions*

- Tall vegetation emerging from water
- Urban areas
- Strong winds blowing

Flooded  
Areas

River

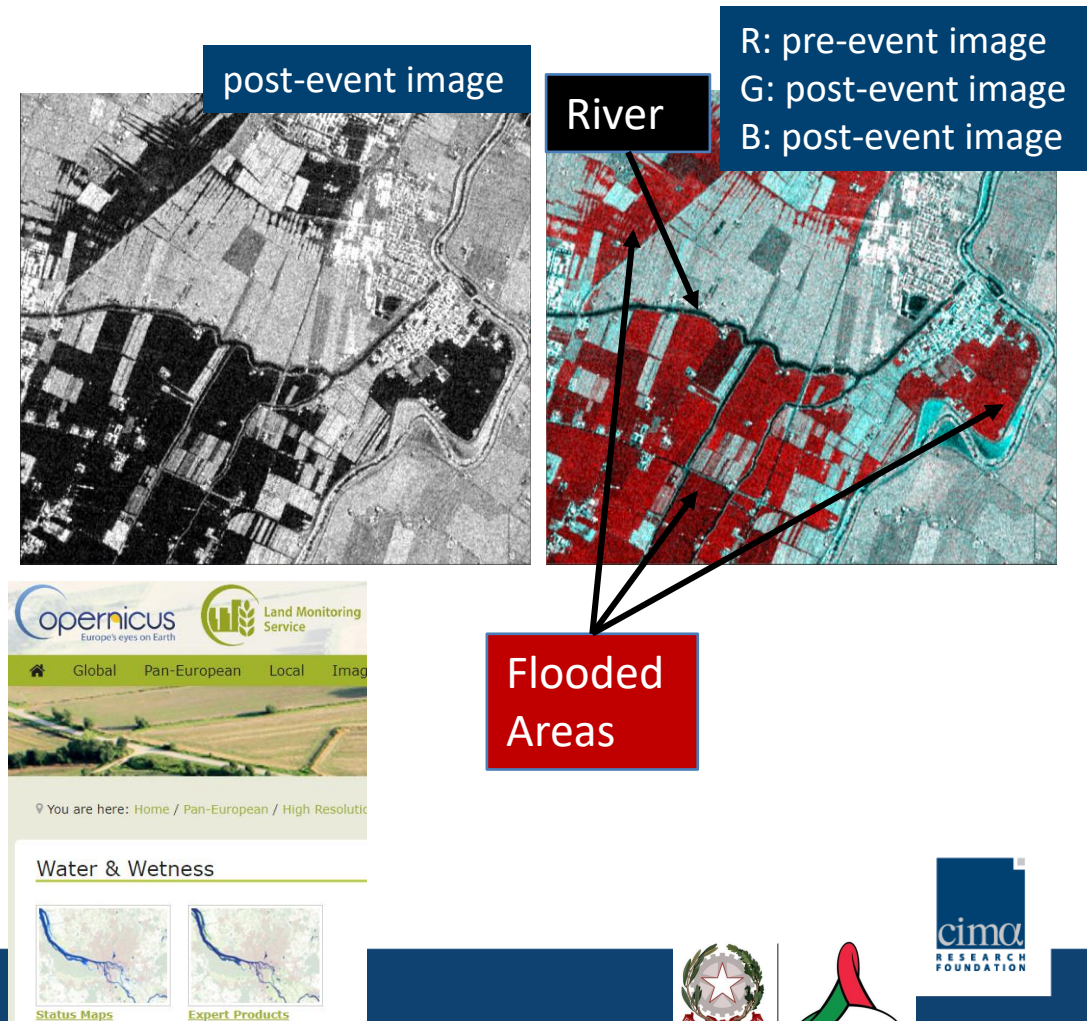

PROTEZIONE CIVILE

# Discrimination btw permanent water and floodwater

- Change (*difference in logarithmic units*) btw pre- and post-event images
- Flood mapping automatic algorithms search for dark targets in SAR images and changes btw pre- and post-event images.
- Ancillary data such as the *Copernicus Water & Wetness product* can help the discrimination

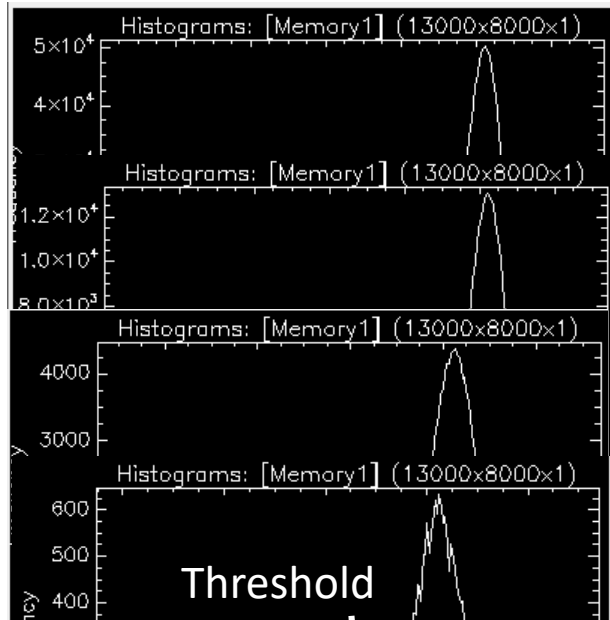

# Water detection method

- A *threshold value* distinguishing water from non-water class has to be found
- Automatic thresholding methods able to automatically find a proper threshold *if the histogram of the data is bimodal*
- This not always happens

# Image splittig

Threshold

Final Map

Automatic thresholding complemented by an unsupervised classification (Isodata)

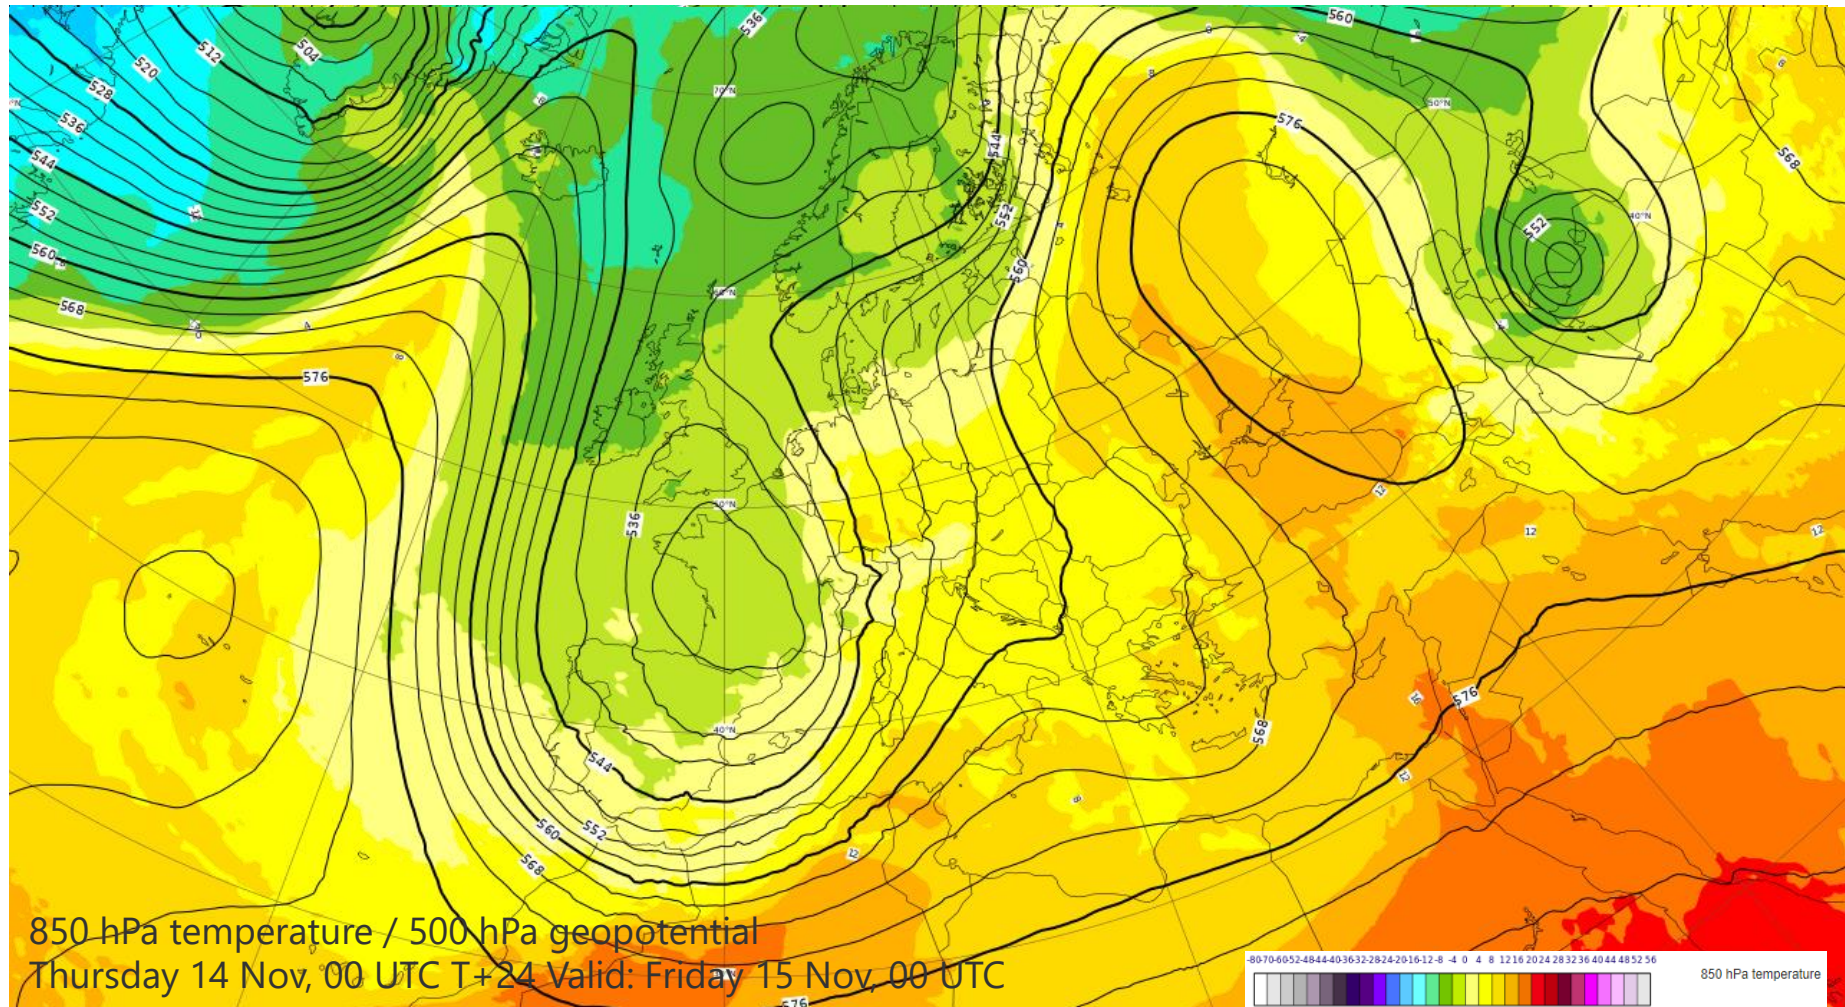

Global Threshold can be computed as the mean of the thresholds of bimodal sub-images

PROTEZIONE CIVILE

# Synoptic situation: ECMWF - 14<sup>th</sup> of November 2019

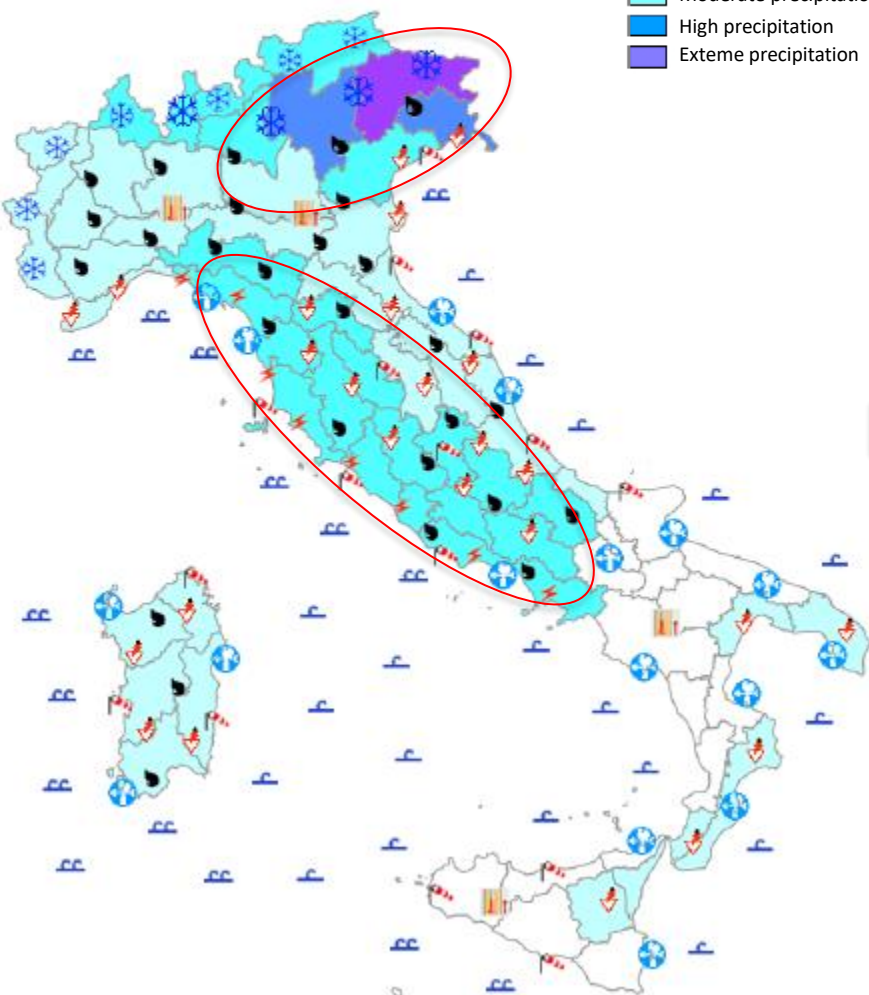

- Main low pressure from UK to Nord Africa with a blocking high pressure over eastern Europe (Russia)
- Southerly very warm air masses in the western Mediterranean with significant precipitation

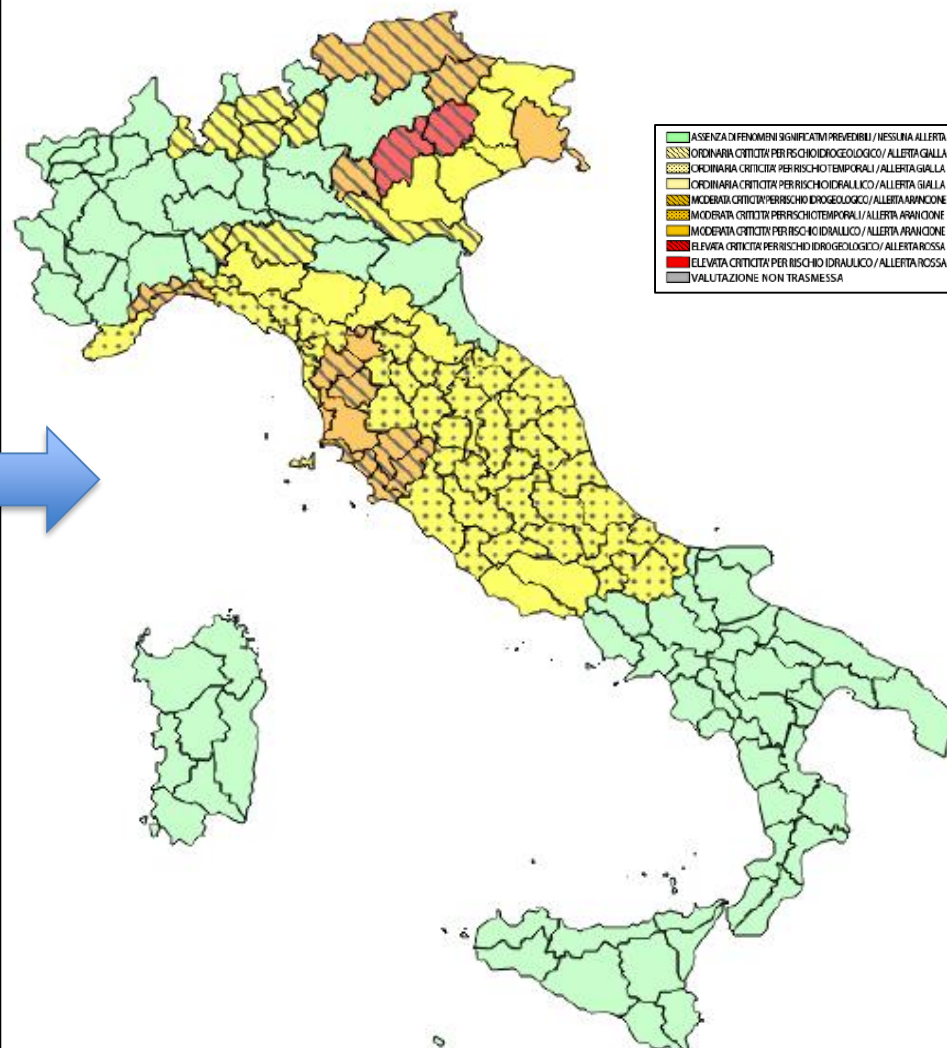

# National Meteorological Surveillance Bulletin: Precipitation forecasted for 15/11/2019

-  No precipitation
-  Low precipitation
-  Moderate precipitation
-  High precipitation
-  Extreme precipitation

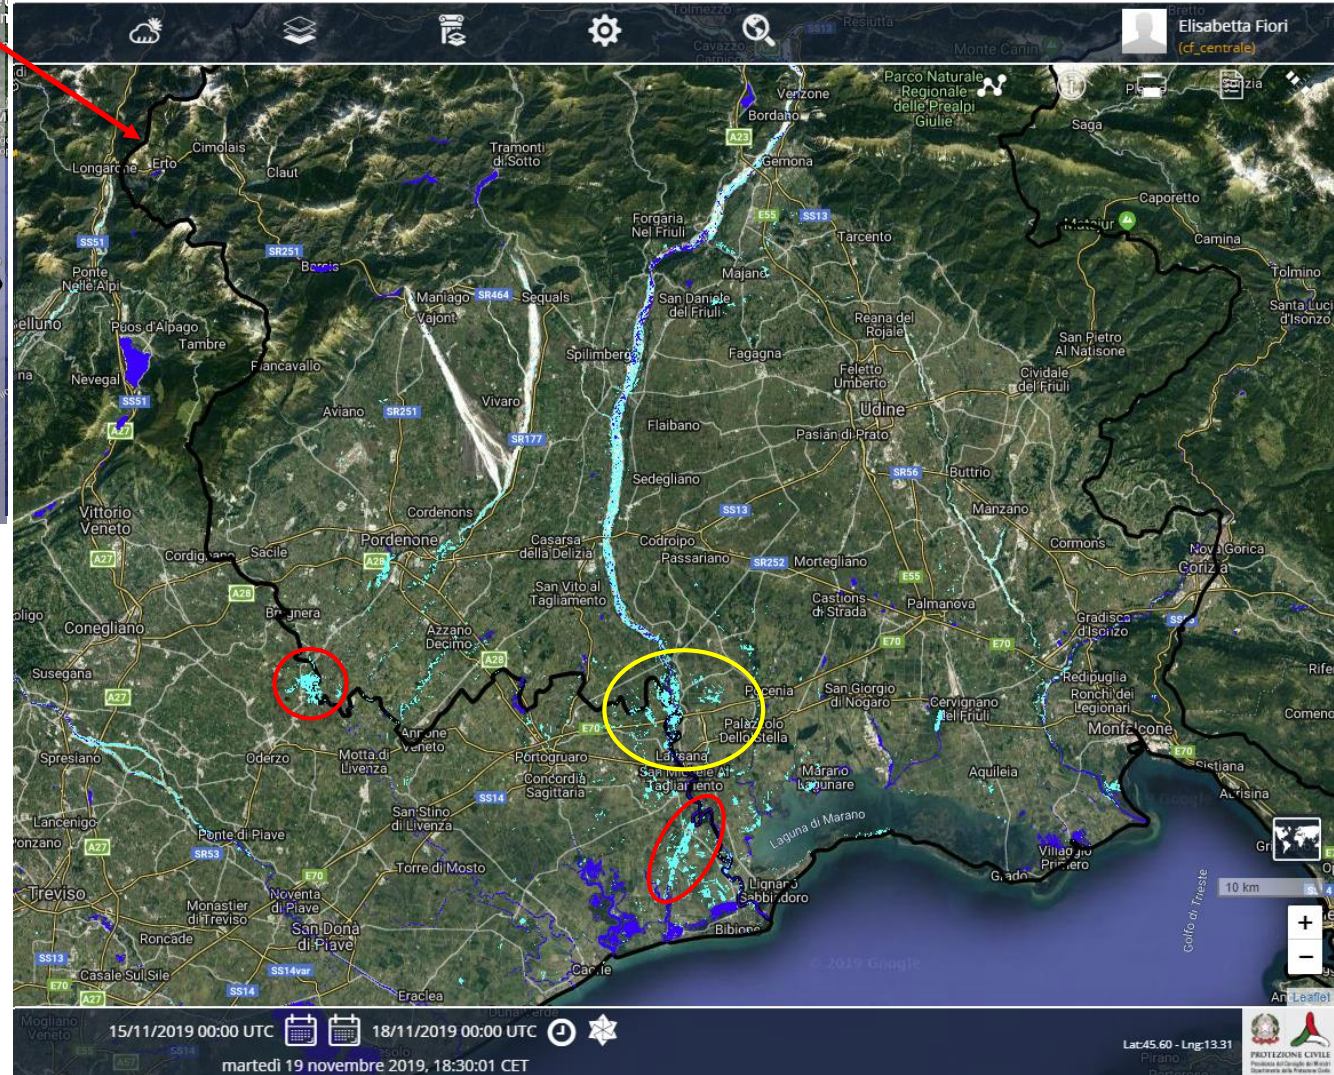

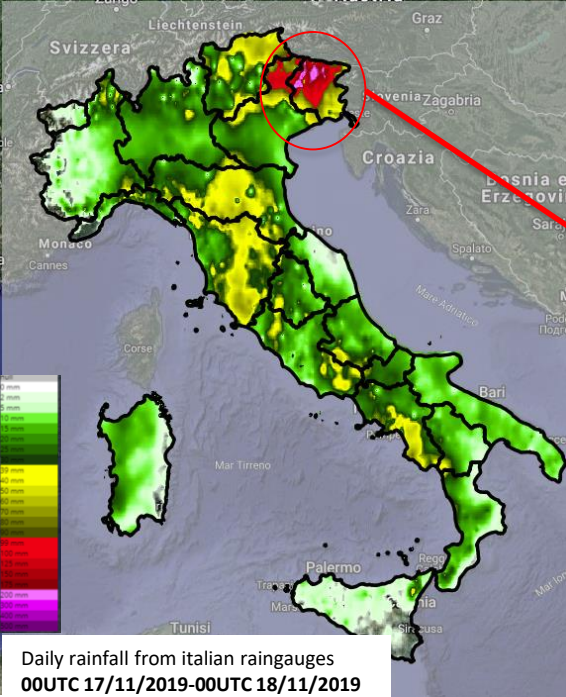

# National Hydrogeological and Hydraulic Criticalities Bulletin: validity on 15/11/2019

-  ASSENZA DI FENOMENI SIGNIFICATIVI PREVEDIBILI / NESSUNA ALLERTA
-  ORDINARIA CRITICITÀ PER RISCHIO IDROGEOLOGICO / ALLERTA GIALLA
-  ORDINARIA CRITICITÀ PER RISCHIO TEMPORALI / ALLERTA GIALLA
-  ORDINARIA CRITICITÀ PER RISCHIO IDRAULICO / ALLERTA GIALLA
-  MODERATA CRITICITÀ PER RISCHIO IDROGEOLOGICO / ALLERTA ARANCIONE
-  MODERATA CRITICITÀ PER RISCHIO TEMPORALI / ALLERTA ARANCIONE
-  MODERATA CRITICITÀ PER RISCHIO IDRAULICO / ALLERTA ARANCIONE
-  ELEVATA CRITICITÀ PER RISCHIO IDROGEOLOGICO / ALLERTA ROSSA
-  ELEVATA CRITICITÀ PER RISCHIO IDRAULICO / ALLERTA ROSSA
-  VALUTAZIONE NON TRASMESSA

# 17 Nov. 2019 - ROI - Friuli Venezia Giulia & Veneto

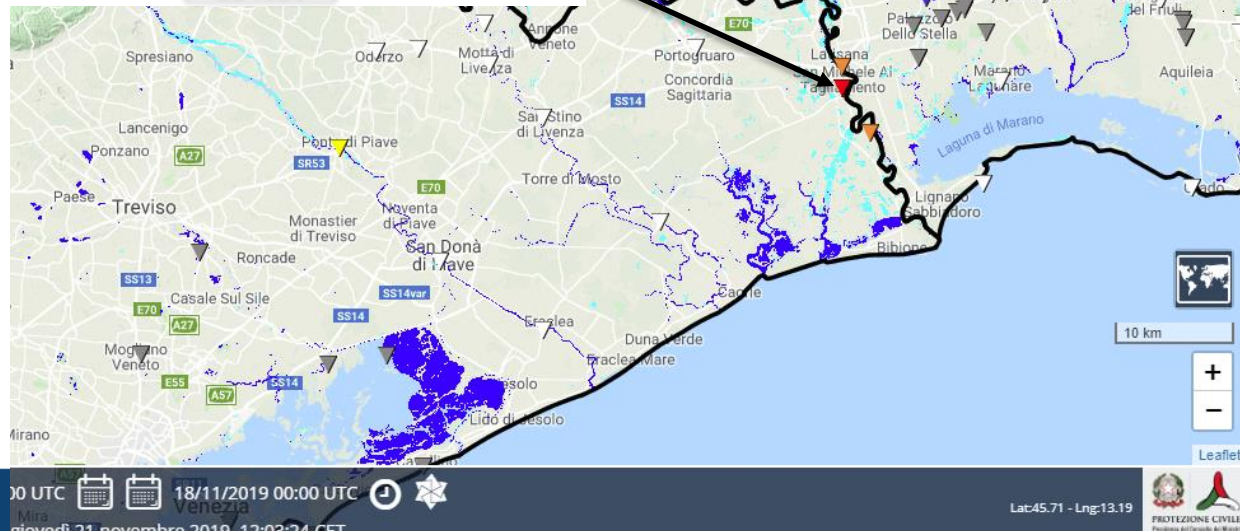

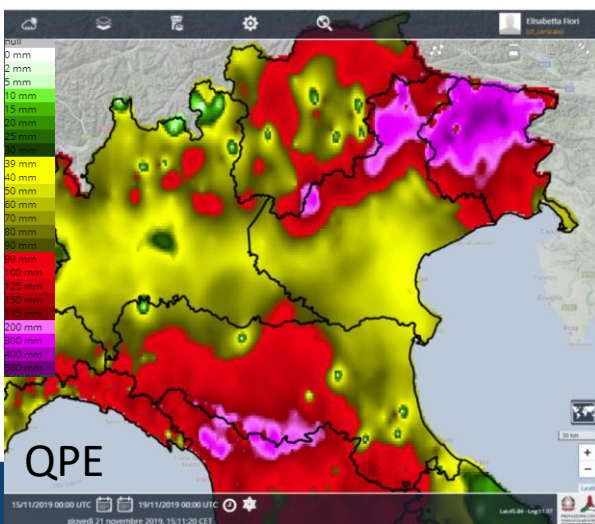

# Hydrometric observations 15 Nov 00UTC - 19 Nov 00UTC

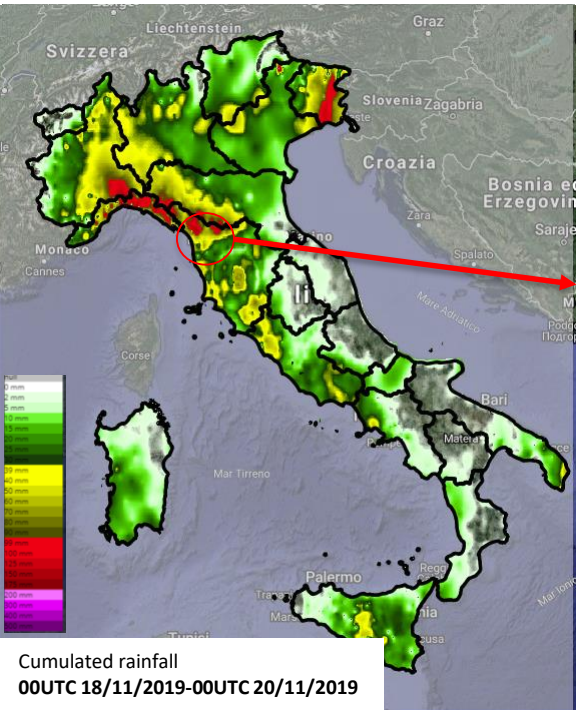

Hydrometric thresholds of 3 different critical levels according to the expected ground effects

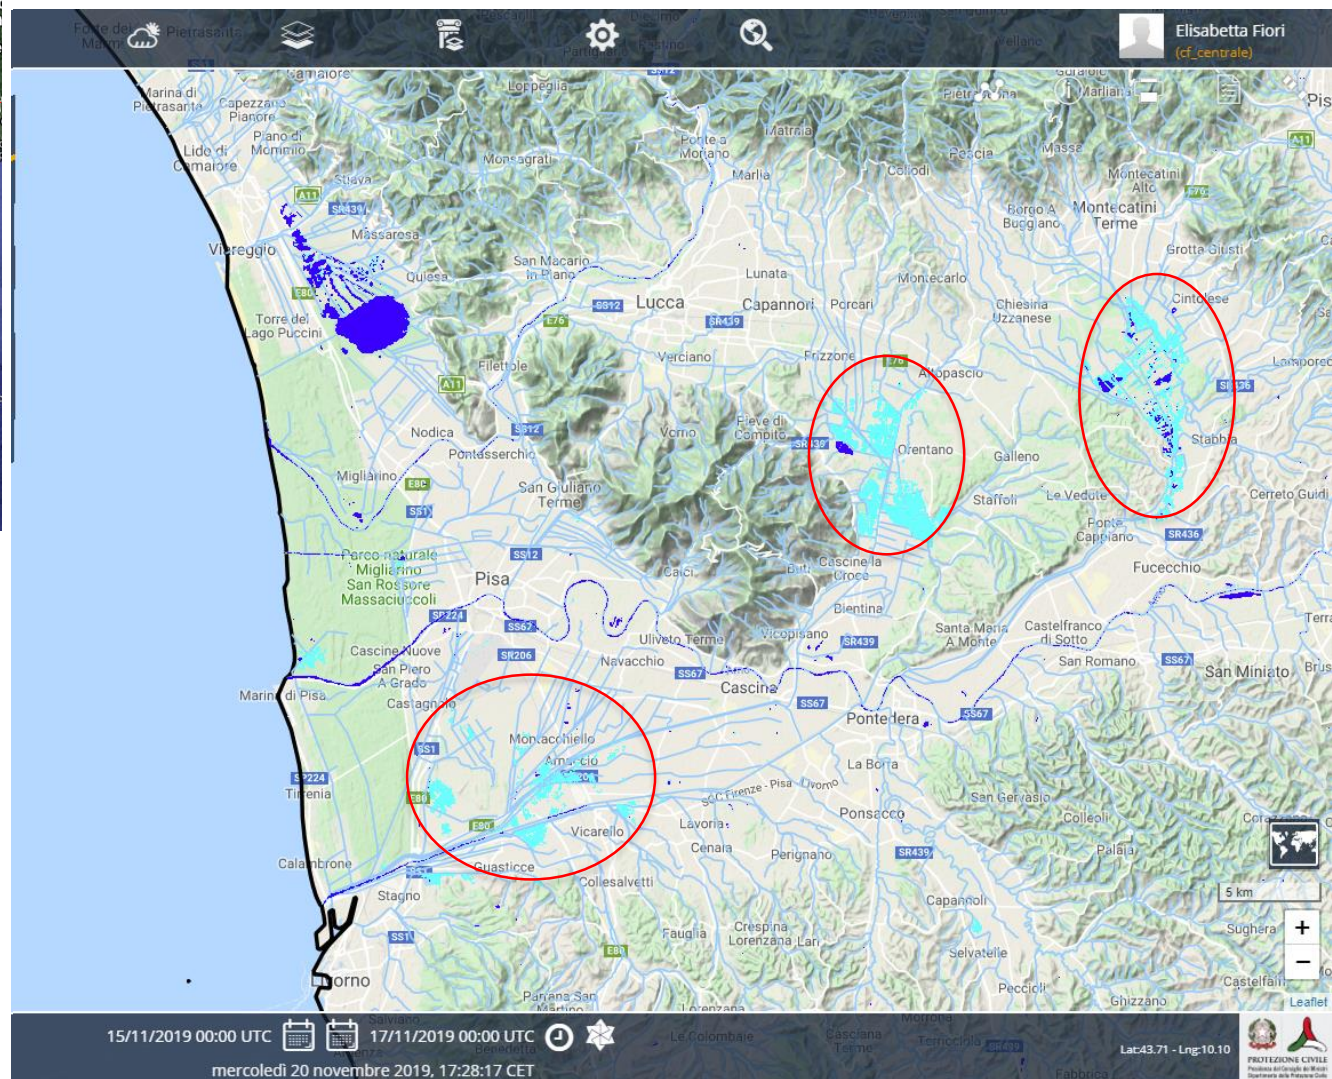

Elisabetta Fiori  
(cf\_centrale)

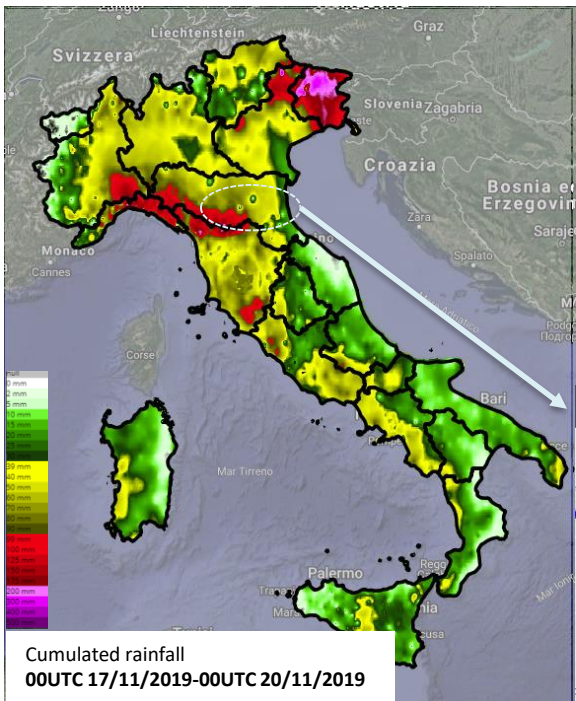

## 20 Nov. 2019 - ROI - Toscana

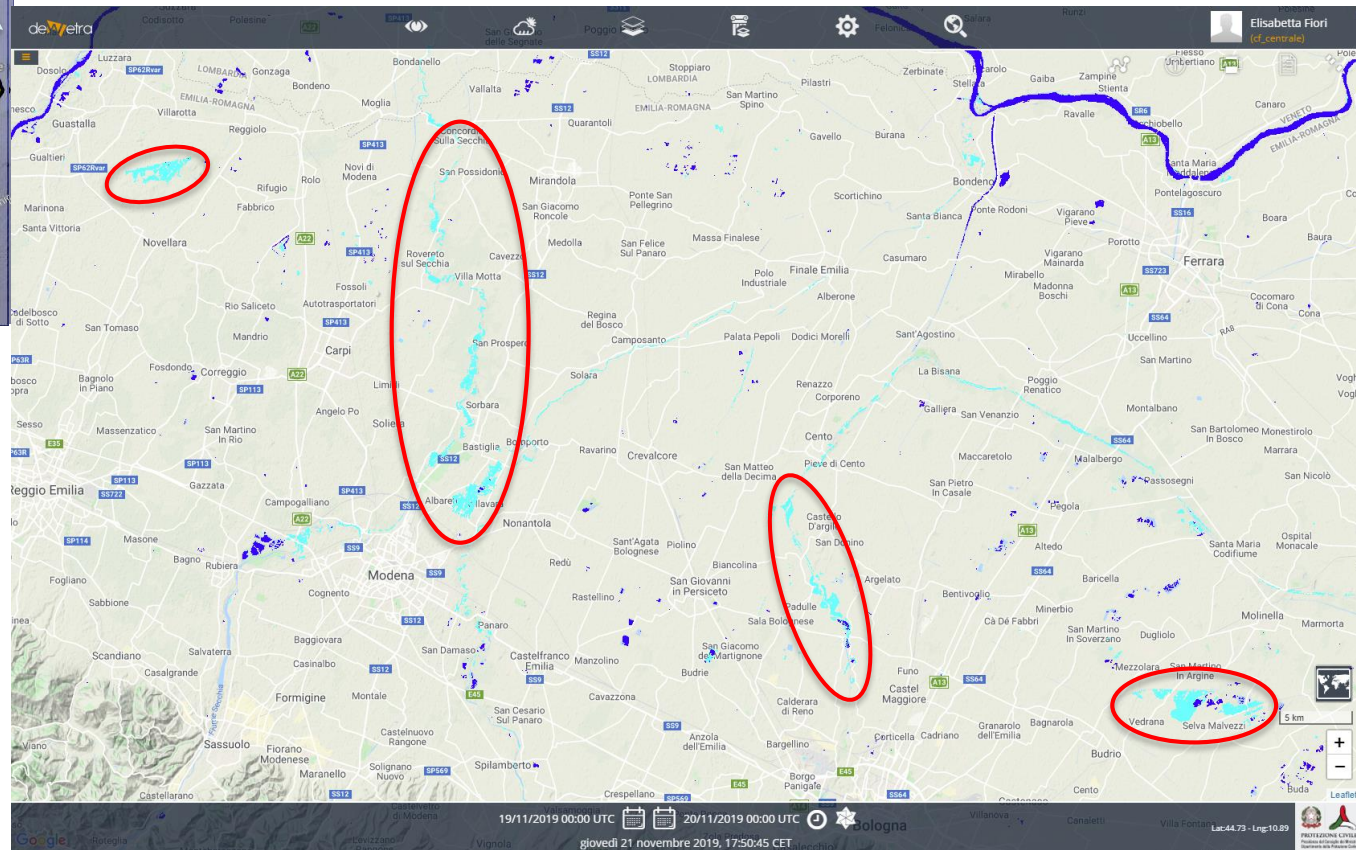

Relative orbit : 168  
Sensing start: 2019-11-20T05:28:03.293Z

## 20 Nov. 2019 - ROI - Emilia-Romagna

# Final remarks

- ❑ AUTOWADE is a fully automatic system and it is scheduled to run twice a day (ascending and descending S1 orbits)
- ❑ AUTOWADE allows end-users:
  - To know the status of the permanent water bodies when high precipitation is forecasted and soil moisture content is very high
  - To monitor in NRT the evolution of the flooded areas at national scale (different regions at the same time)
  - To avoid time consuming activation procedures.
- ❑ AUTOWADE complements on-demand systems like Copernicus Emergency Management Service - Mapping

# Thank you for your attention
