

Satellite inspired hydrology in an uncertain future: a H SAF and HEPEx workshop

Contribution ID: 87

Type: **Oral presentation**

H SAF precipitation products: Quality assessment and hydro validation

Monday, 25 November 2019 16:00 (20 minutes)

The H SAF concept was born on the requirements of the hydrologic community and is focused on the development and operational delivery of satellite products that can be used in work pursued by the National Hydrological Services and water management institutions. In H SAF program are available two types of validation on precipitation products: quality assessment and hydrological validation. For the first one, the H SAF Precipitation Product (PP) Validation Group (VG) analyses annually all the PP released by the consortium in order to evaluate their performance over time. On the European area validation is carried out by comparison with ground radar and raingauge data available within the consortium. For products with hemispherical/global coverage the comparison is performed with precipitation estimates by the DPR (Dual-frequency Precipitation Radar) product onboard of GPM satellite that combines both Ku and Ka frequencies. In the second one, the H SAF Hydrological Program is focused on an assessment of PP from a hydrological point of view: it includes products interfacing with hydrologic models. The methodology developed, models and basins used, and instruments applied will be briefly described in order to show results achieved by the H SAF PP.

Which session would you like to present in?

Primary author: PETRACCA, Marco (Civil Protection Department)

Co-authors: PUCA, Silvia (Italian Civil Protection); KASINA, Michal (Italian Civil Protection Department); QUALITY ASSESSMENT AND HYDRO VALIDATION CLUSTERS

Presenter: PETRACCA, Marco (Civil Protection Department)

Session Classification: H SAF products and quality assessment

Track Classification: H SAF and HEPEx joint workshop on "Satellite inspired hydrology for an uncertain future"
