

Author: H SAF snow and validation clusters

H SAF snow cover (H10, H12) and snow water equivalent (H13) products are comprised of either Near Real-Time (NRT), Offline or Climate Data Records (CDR), which are freely available at the H SAF data portal. Examples of downloading, reading and displaying snow cover and snow water equivalent data in Python are presented. A time series example application in retrieving the snow parameters at a point and at a basin scale is presented.
