Clouds (3)

Thursday, 2 April 2020 09:15 (1 hour)

Building on the previous two Cloud sessions, the practical implementation of a cloud parametrization is described, using the ECMWF global model as an example appropriate for global weather forecasting.

By the end of the session you should be able to:

- explain the key sources and sinks of cloud and precipitation required in a parametrization
- describe the main components of the ECMWF stratiform cloud parametrization
- recognise the limitations of approximating complex processes.

Presenter: FORBES, Richard (ECMWF)
