Snow land observations: overview, recent developments

M J Sandells

With thanks to:

S. Pullen, C. Charlton-Perez, P. De Rosnay,

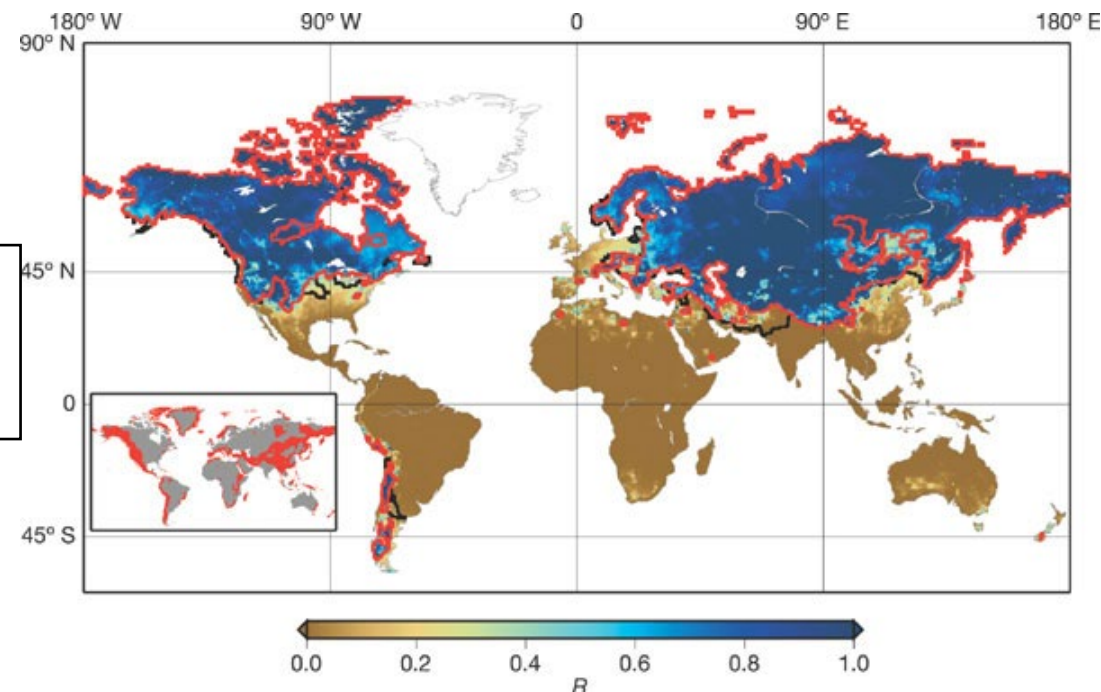

M. Dumont, N. Rutter

Key Messages

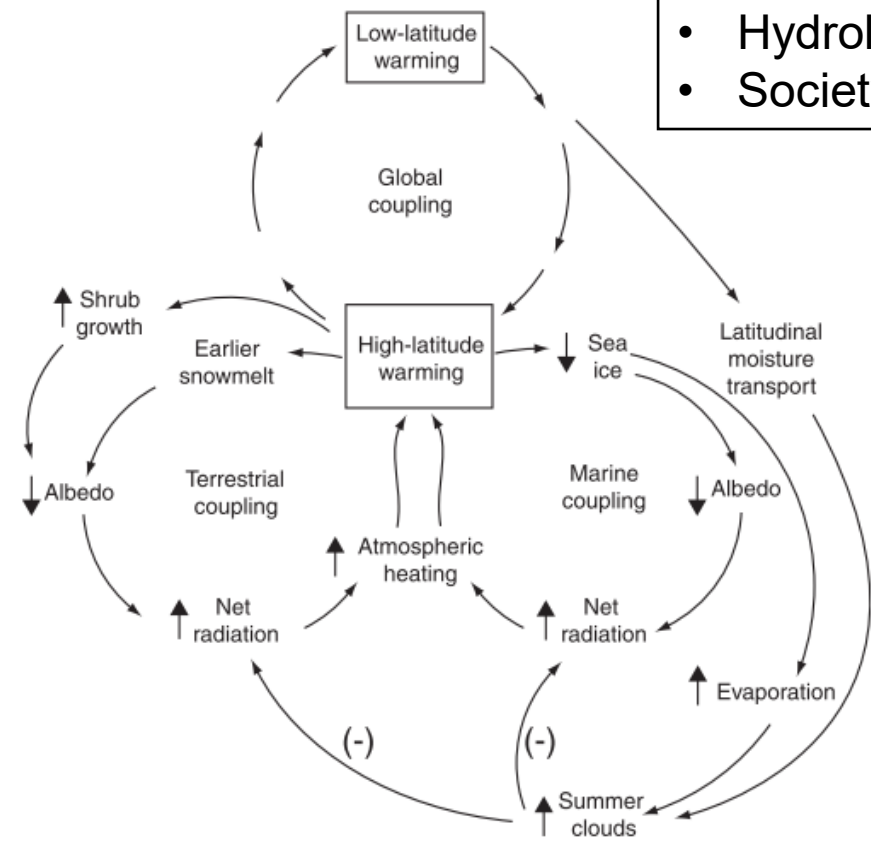

- Snow matters: NWP, climate, hydrology, society
- Reporting of snow data is increasing but 'no snow' reports lacking
- In-situ measurements (know a lot about a point) or broader picture from remote sensing
- Currently underutilizing observations BUT exciting opportunities ahead

Why snow matters

- NWP/ Climate
- Hydrology
- Society / Economics

Barnett et al., 2005

Chapin et al., 2005

Water Resources Research

COMMENTARY
10.1002/2017WR020840

Special Section:
Earth and Space Science is
Essential for Society

Key Points:
• Snow is a critical but often-
unappreciated resource used by

Water and life from snow: A trillion dollar science question

Matthew Sturm¹, Michael A. Goldstein², and Charles Parr¹

¹Geophysical Institute, University of Alaska-Fairbanks, Fairbanks, Alaska, USA, ²Finance Division, Babson College, Wellesley, Massachusetts, USA

Abstract Snow provides essential resources/services in the form of water for human use, and climate regulation in the form of enhanced cooling of the Earth. In addition, it supports a thriving winter outdoor recreation industry. To date, the financial evaluation of the importance of snow is incomplete and based

Sturm et al. (2017)

Home Observation Requirements Space-based Capabilities Surface-based Capabilities Analysis

Overview Variables Requirements Layers Themes Application Areas

snow

- Variables
- Snow cover
 - Snow status (wet/dry)
 - Snow water equivalent
 - Sea-ice surface characteristics
 - Snow depth
 - Precipitation type at the surface
 - Hydrometeor type

List of all Variables

This table shows all variables. It can be sorted by clicking on the column headers. The filter on the right allows to display only specific variables. [Filter instructions](#)

Id	Variable name	Domain	Measurement unit	Definition	Uncert. Units	Required for
318	(13)CH4 Delta	Atmospheric chemistry	‰	3D field of Delta C-13 in CH4 (Methane) (isotopic signature)	%	

No SWE sensor at these resolutions => some in-situ depth + snow cover

Requirements depend on application e.g. snow water equivalent (mass):

Daily, 100m resolution, 5mm uncertainty (Hydrology)

Vs

Hourly, 500m resolution, 5mm uncertainty (high resolution NWP)

Vs

Daily, 1km resolution, 10mm uncertainty (Climate monitoring)

In-situ: snow depth

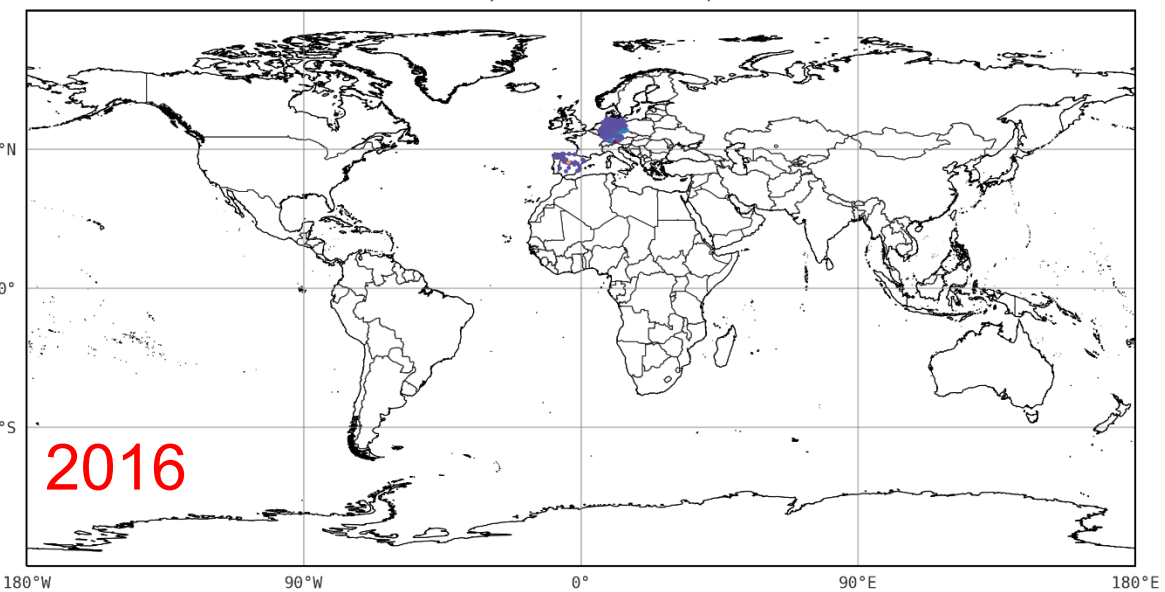

=> How are these data used in NWP?

Met Office Global SYNOP BUFR reporting

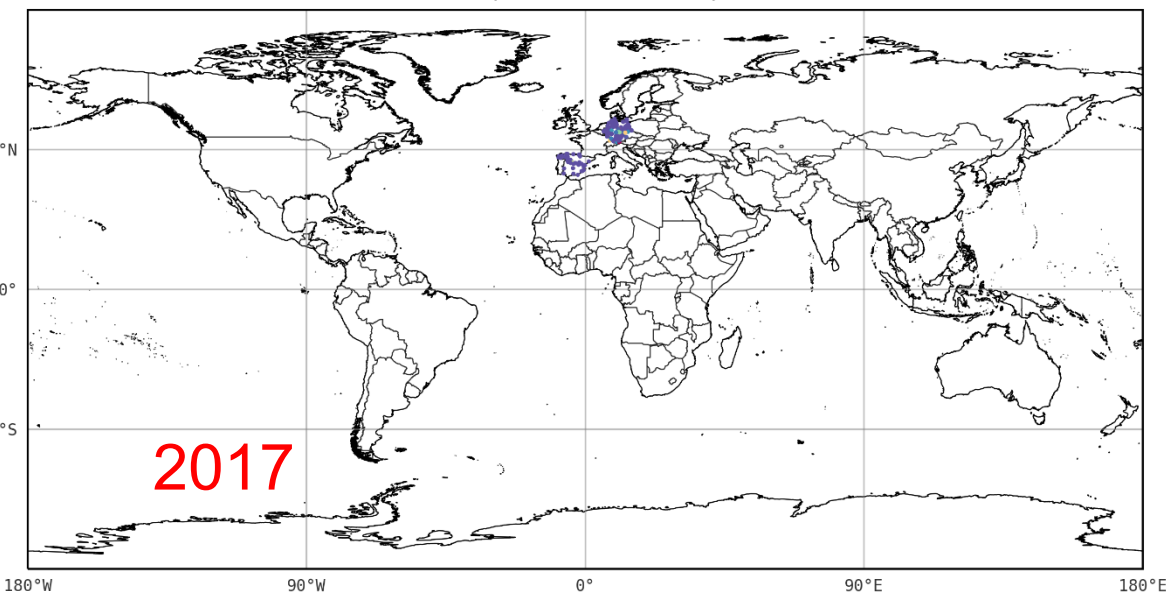

S. Pullen

LND SYB:SNOW_DPTH
20160301/0000Z-20160301/2359Z

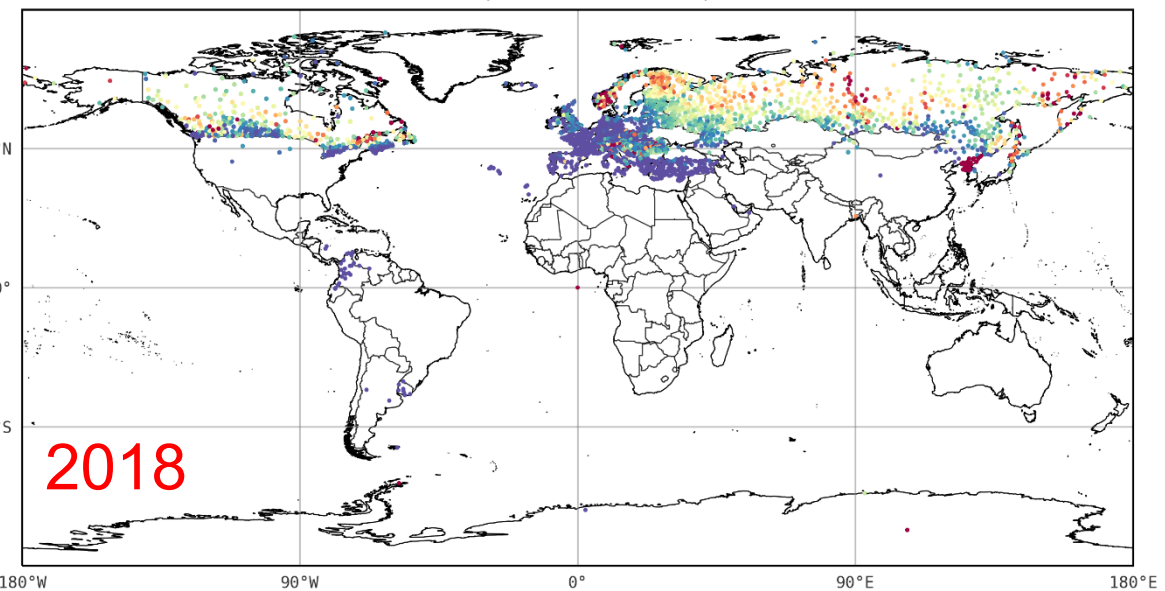

2016

LND SYB:SNOW_DPTH
20170301/0000Z-20170301/2359Z

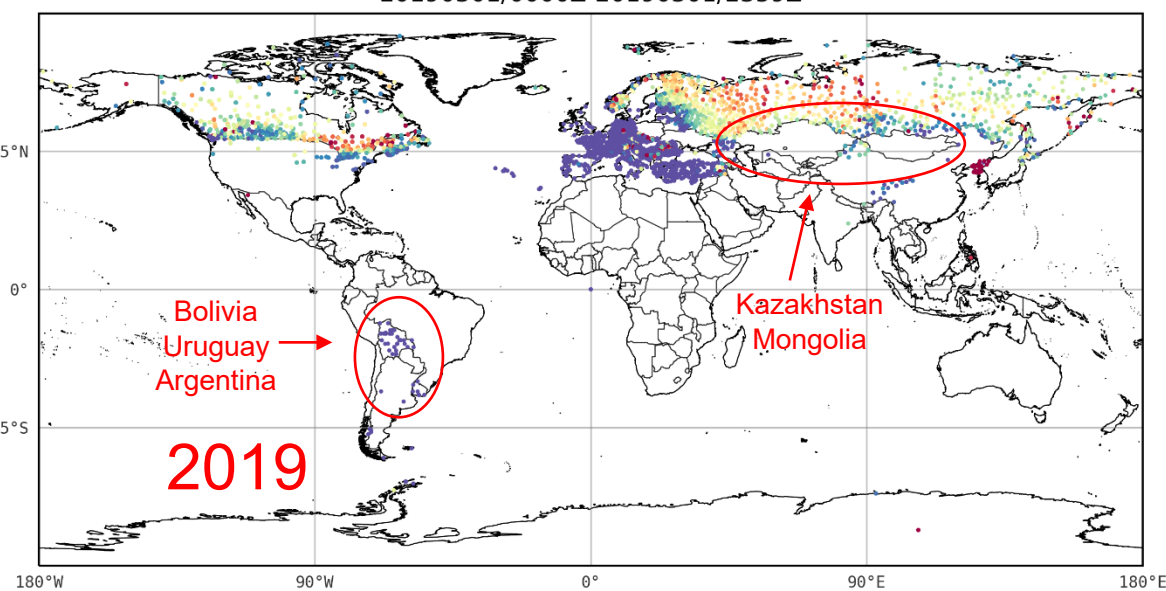

2017

LND SYB:SNOW_DPTH
20180301/0000Z-20180301/2359Z

2018

LND SYB:SNOW_DPTH
20190301/0000Z-20190301/2359Z

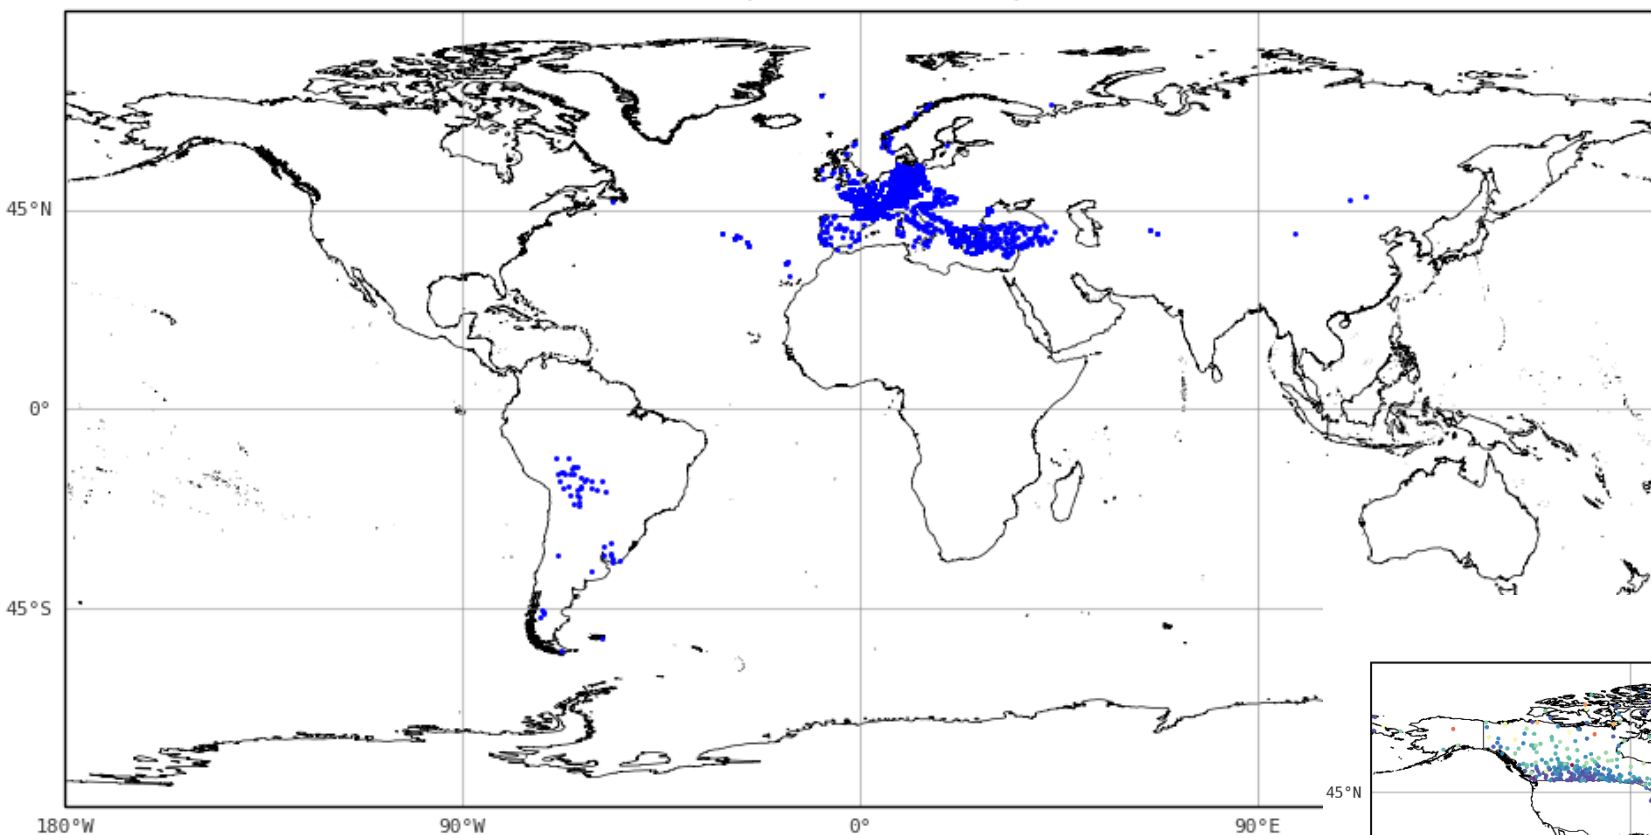

2019

Global reporting of zero snow depth

LND SYB:SNOW_DPTH
20181220/0000Z-20181220/2359Z

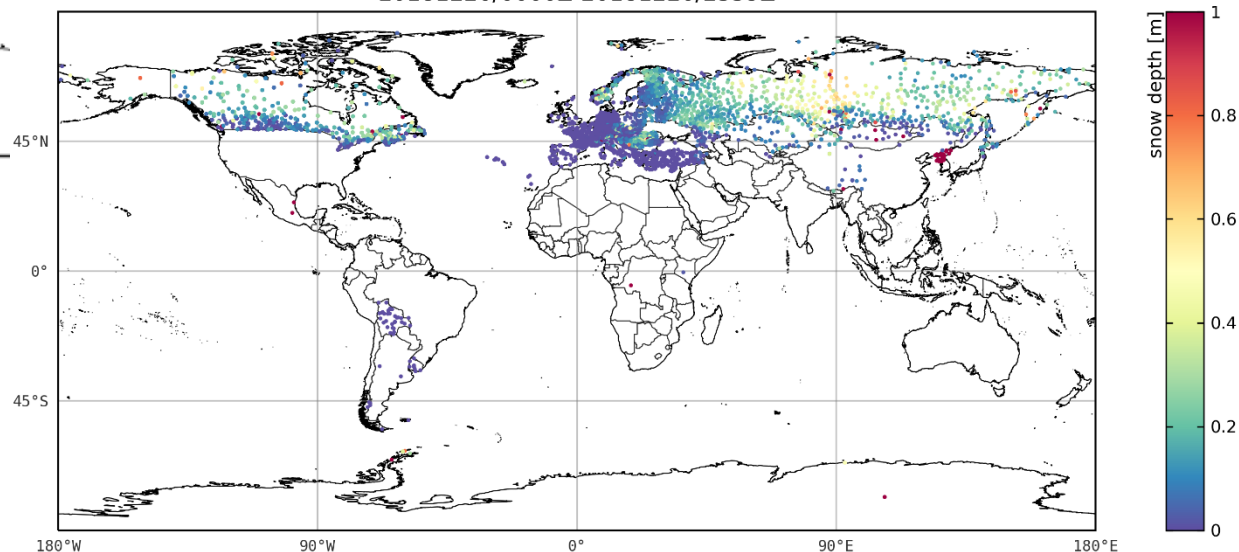

December 2018

Good uptake in Europe

Some in China, S. America

LND SYB:SNOW_DPTH
20181220/0000Z-20181220/2359Z

=> Why does zero snow depth reporting matter?

Why getting the snow right matters

Bonan et al. (2008), Science

Expts	SYNOPSIS	National Data	IMS snow cover
0- OL (no snow data assimilation)			
→ 1- Snow DA: SYNOPSIS+IMS	✓		✓
→ 2- Snow DA: SYNOPSIS+Nat (all in situ)	✓	✓	
★ 3- Snow DA SYNOPSIS+Nat+IMS (all)	✓	✓	✓

Impact on T2m Forecasts:
Normalized RMSE for T2m FC difference compared to the reference (no snow DA)

- Ref (no snow DA)
- SYNOPSIS+IMS (1-0)
- SYNOPSIS+Nat (2-0)
- SYNOPSIS+Nat+IMS (3-0) -> oper

=> Patricia De Rosnay
Weds 3pm

Best T2m Forecast when all observations, combining in situ and IMS, are assimilated.

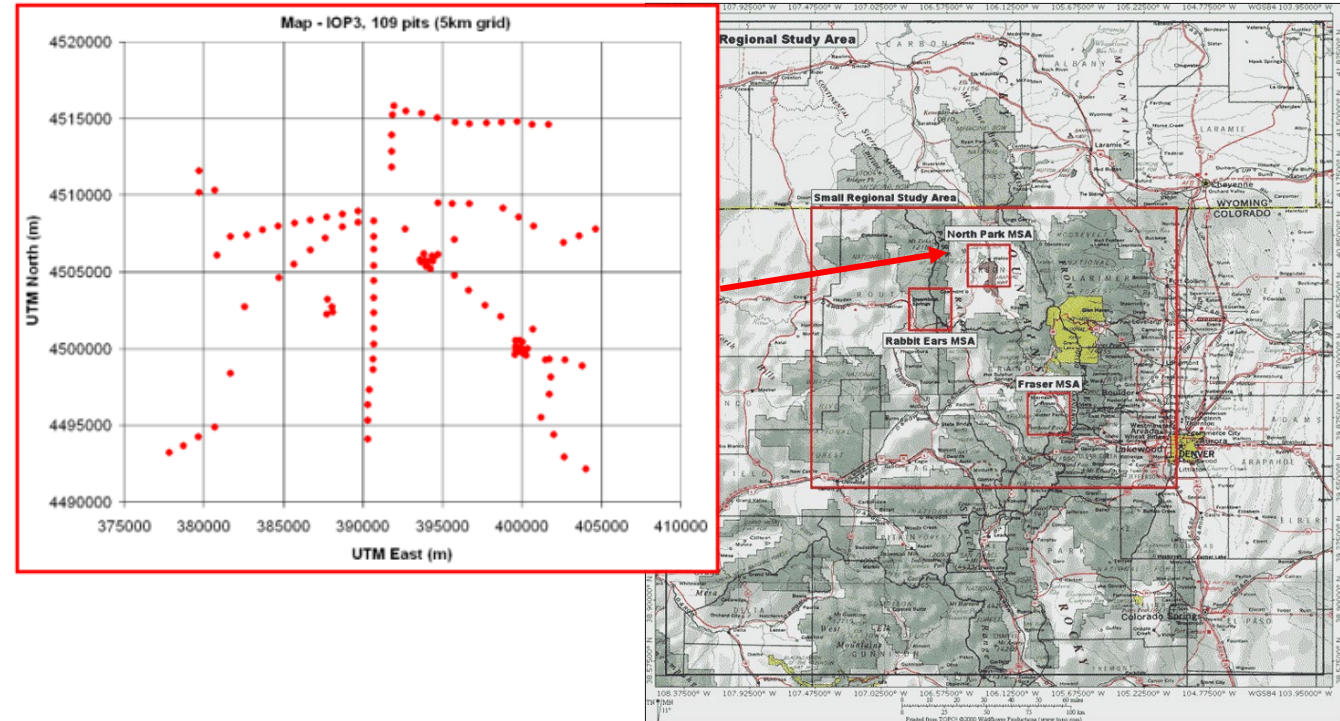

In-situ vs remote sensing

Rutter et al., JGR-Earth Surface (2014)

=> Remote sensing offers (global) measurements at more useful scales....

- Can know a lot about a little snow (in-situ) but may not be representative of larger area e.g. SNOTEL sites

Cline, D., R. Armstrong, R. Davis, K. Elder, and G. Liston. 2002, Updated July 2004. *CLPX-Ground: ISA Snow Pit Measurements*

Remote sensing: snow depth

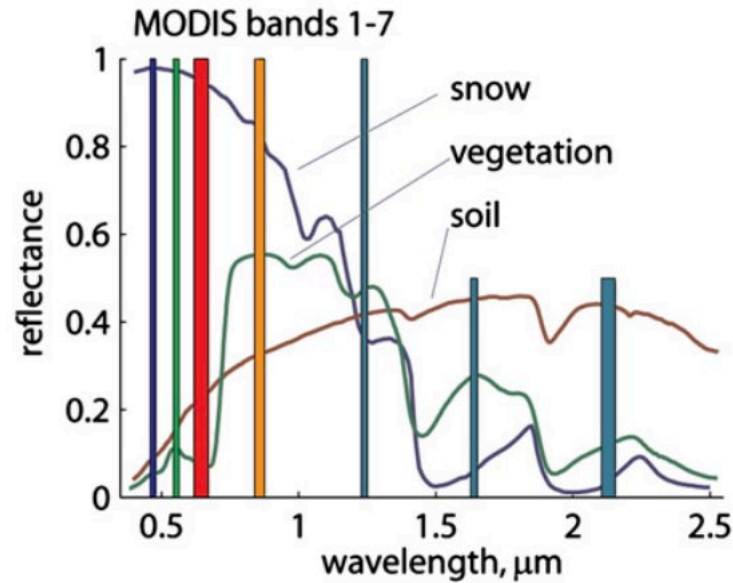

Airborne Snow Observatory

Remote sensing: snow cover

@NASA Terra 7th Jan 2010

Painter et al., RSE, 2009

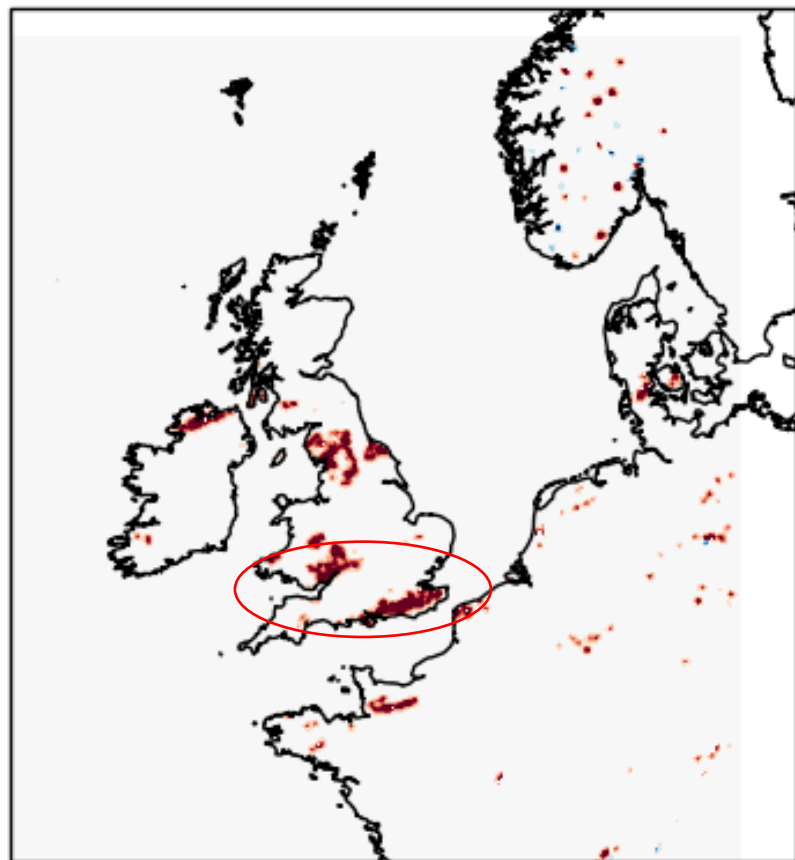

- Daytime, cloud-free conditions
- Resolution 10-100s metres
- Can use spectral mixing theory to get fractional snow covered area

■ Control (06Z)

Trial (06Z)

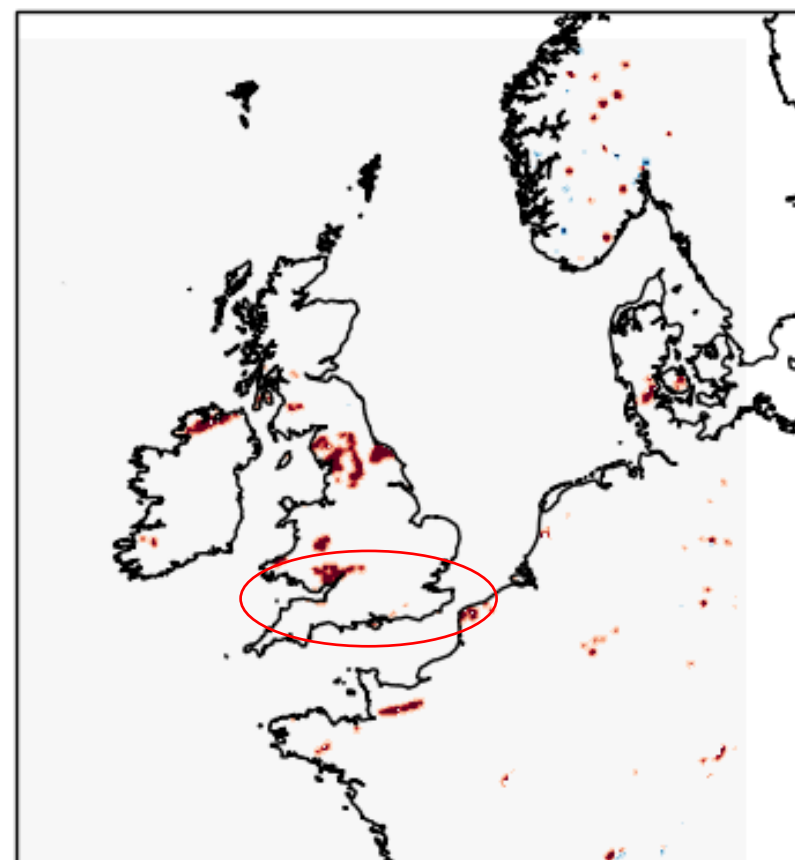

Analysis increments snow amount 16/12/2019

Min = -30.202967 Max = 9.248086

Analysis increments snow amount 16/12/2019

Min = -32.043007 Max = 9.815017

Ground-based Synop network

- snow depth
- state of ground (snow or no snow)

Satellite data from MSG-SEVIRI

- EUMETSAT H-SAF (H31) daily snow cover product

What about snow mass?

Mudryk et al., J. Climate, 2015

GlobSnow: passive microwave +
assimilation of station snow depth
(microstructure estimate)

Dataset	Abbreviation	Snow scheme	Land model	Forcing data	Resolution
GlobSnow	GS	Satellite passive microwave	+ in situ ^a		25 km
ERA-Interim/Land	E	Simple	HTESSEL	ERA-Interim	3/4° × 3/4°
MERRA	M	Intermediate	Catchment	MERRA	1/2° × 2/3°
Crocus	C	Complex	ISBA	ERA-Interim	1° × 1°
GLDAS-2	G2	Simple	Noah 3.3	Princeton Meteorological	1° × 1°

In-situ observations: snow density

Remote sensing: snow mass

- Snow scatters microwave radiation
 - Sensitive to snow mass + microstructure
 - New models (e.g. SMRT) to understand microwave scattering
 - New microstructure measurement techniques (SMP, micro-CT, infrared reflectance)
- ⇒ **Interpret satellite observations**
(past + present)

Silis / Pete Toose

Summary + Perspectives

- Get snow right! => mass / energy atmosphere exchanges
 - zero snow depth reporting matters!
- In-situ measurements: know a lot about a point, representative?
- Remote sensing data: greater coverage but hard to interpret
- 100m-1km SWE requirements challenging but new sensors on horizon
- Microwave observations are underutilized for NWP
- We are making huge advances in understanding snow (mature enough for coupled DA)
- We have 40+ years of microwave data: invest in people to use it
