UEF 2021, 1-4 May 2021

MISTRAL project

1 EUROPEAN PROJECT

Project funded under the Connecting Europe Facility (CEF) – Telecommunication Sector Programme of the **European Union** and started on 1 October 2018.

2 GOAL

The **GOAL** of the MISTRAL portal is to facilitate and foster the **re-use of the datasets** by the **weather community**, as well as by its cross-area communities, to provide added value services through the use of **HPC resources**, turning it into the level of new business opportunities.

1 ECMWF ROLE

Exploit CINECA supercomputer facilities to combine the most skilful aspects of two 6-h precipitation forecasts:

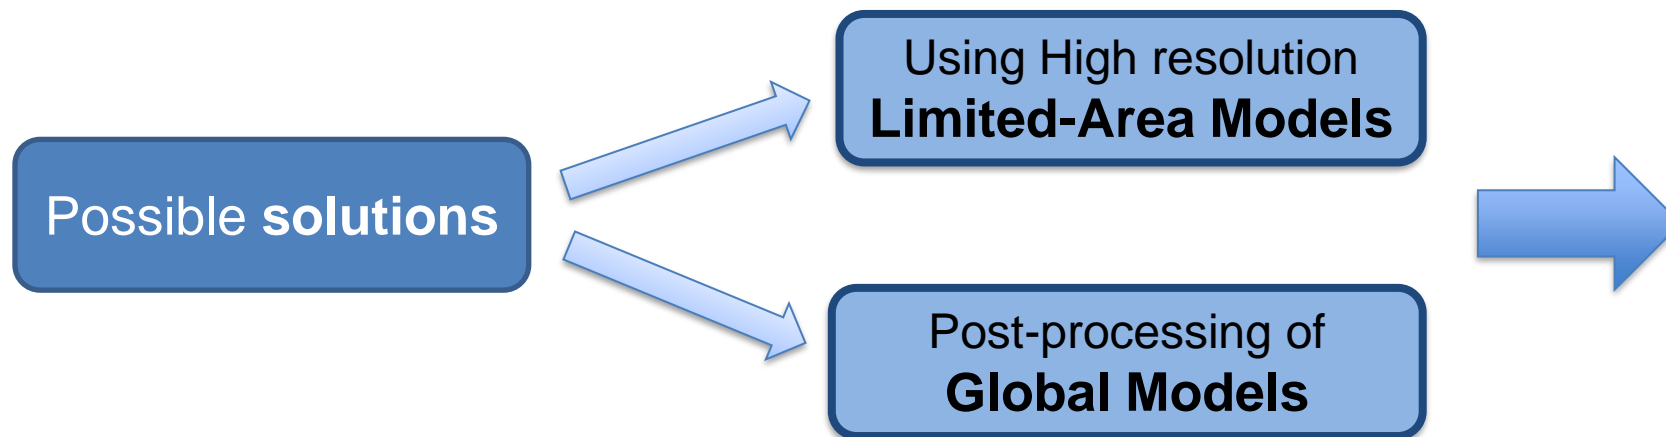

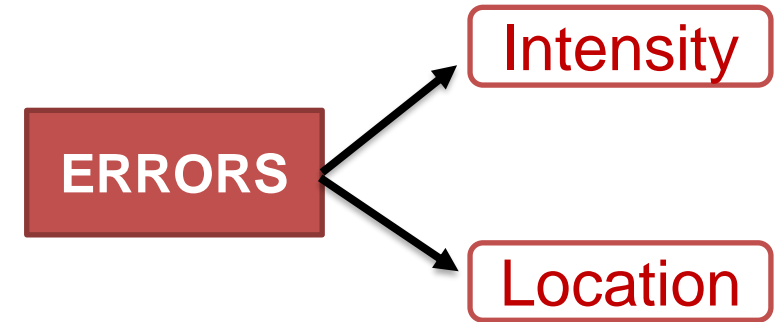

1. **ecPoint Rainfall** product from IFS ENS (ECMWF)
2. **COSMO-2I EPS 2.2 km** resolution + **new post-processing** method

Motivation

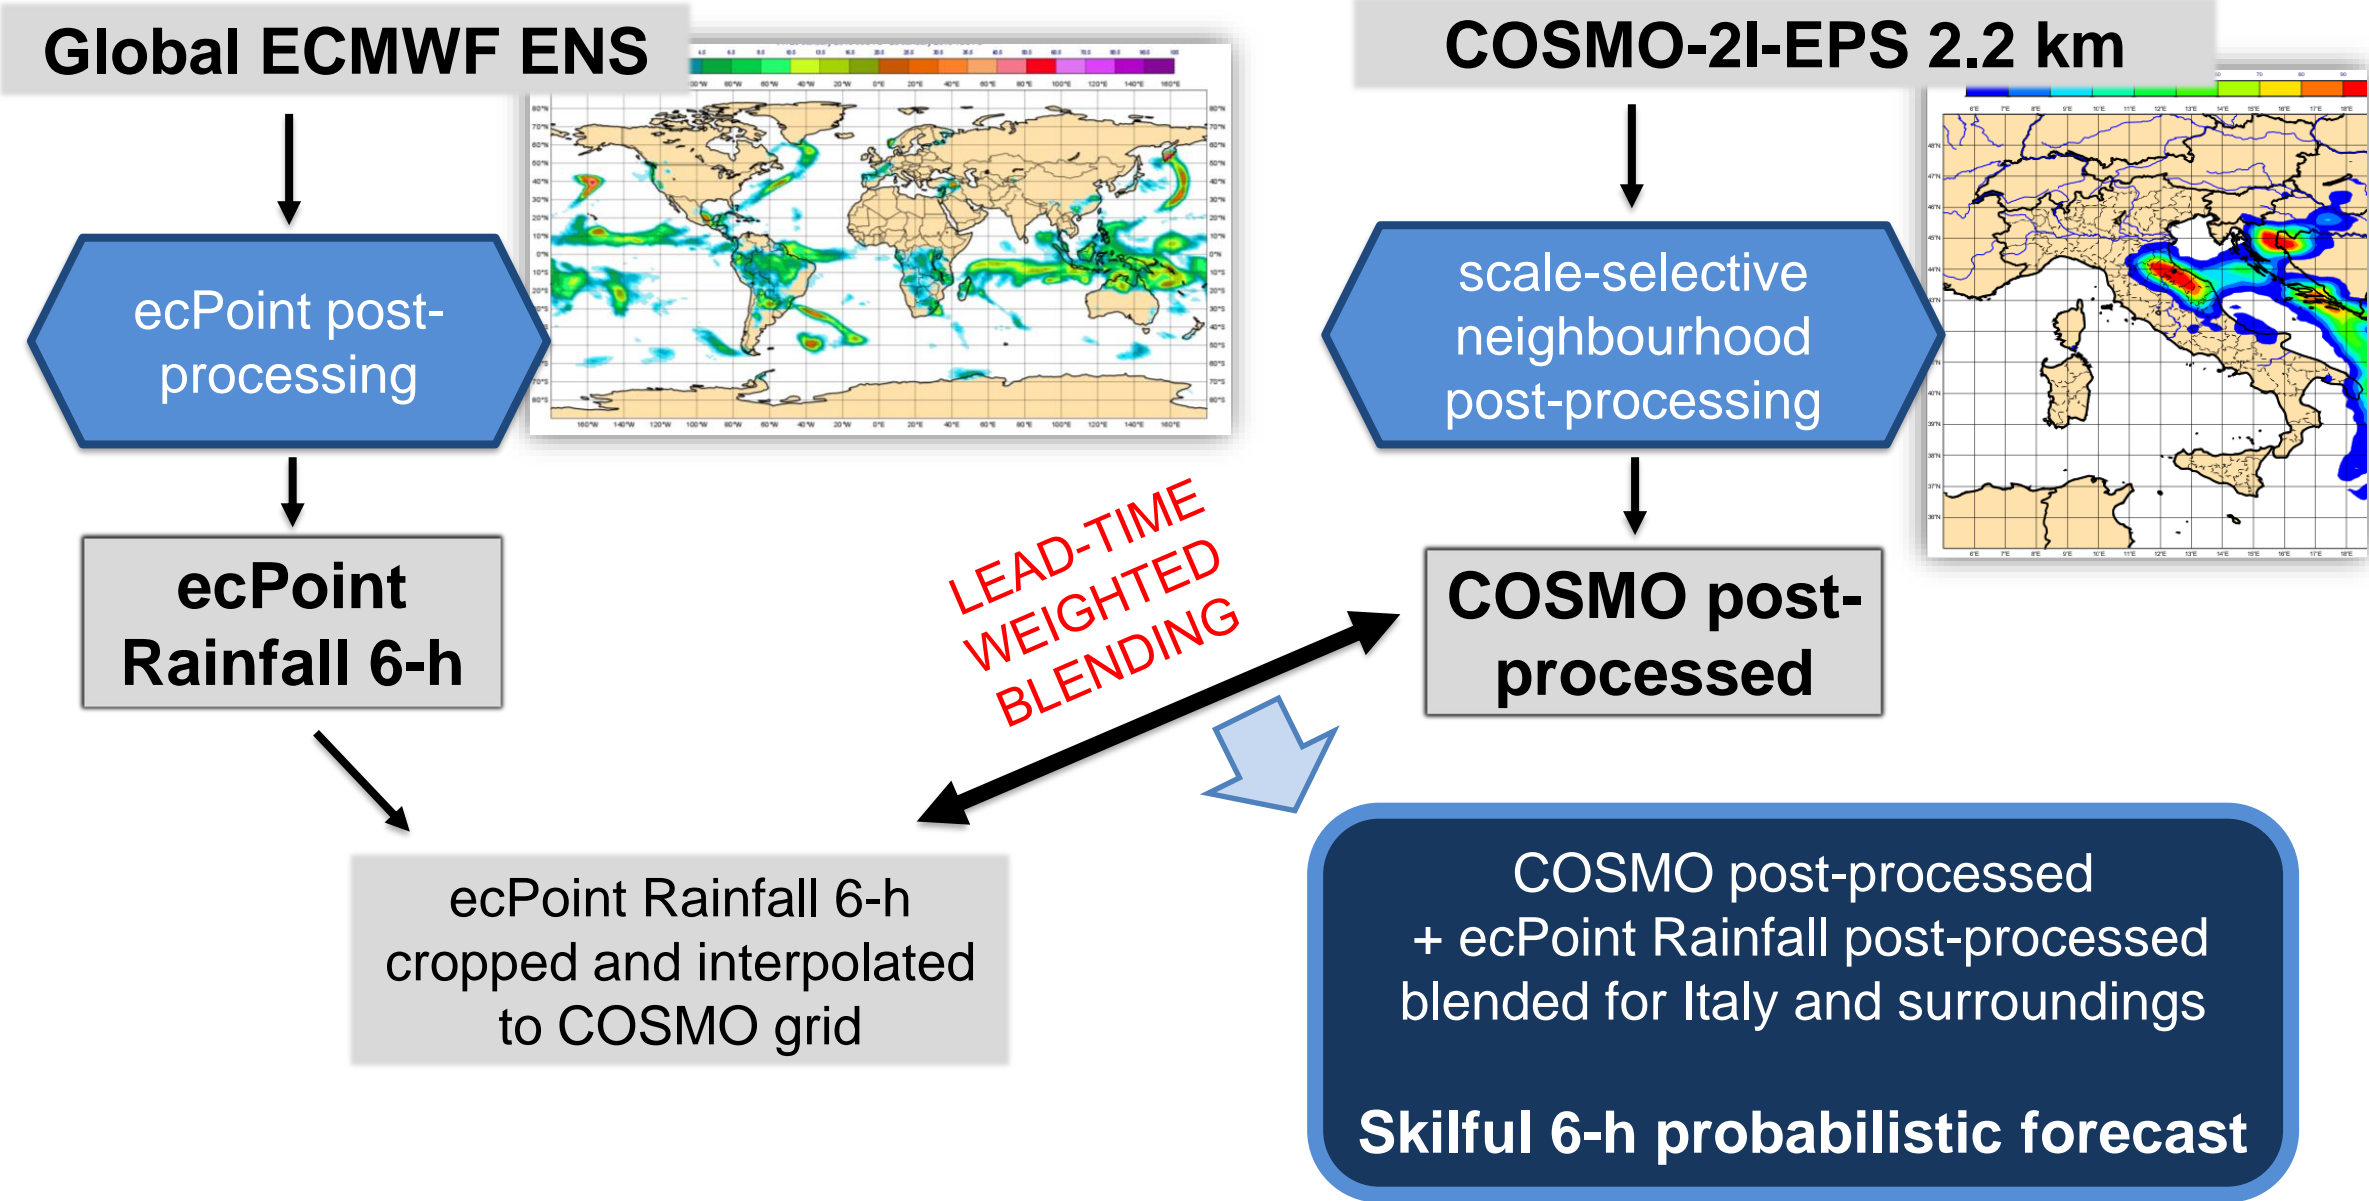

Weather forecasts can present **large errors** because they are calculated for grid boxes in large regions, not for points.

Larger errors in localized convection rather than for large-scale precipitation

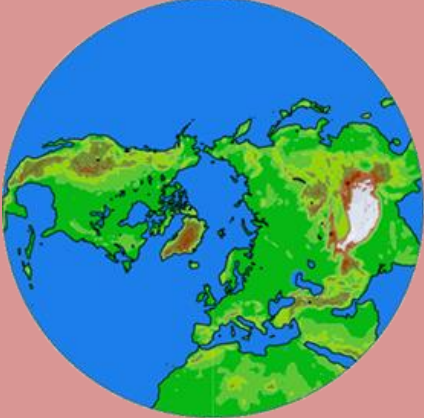

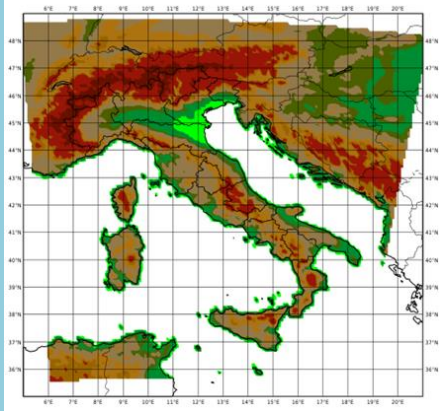

Limitations in FLASH FLOOD predictions

Workflow for 6-h precipitation forecast

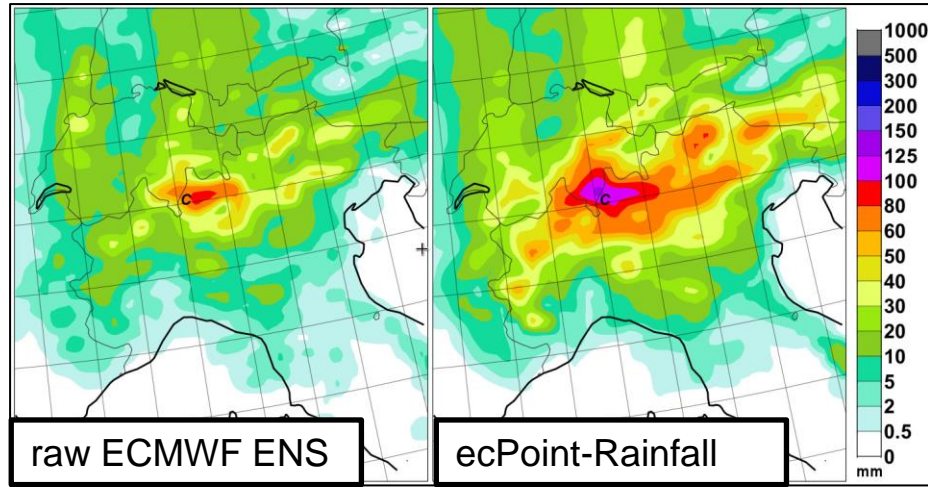

The raw ensemble systems: **ECMWF ENS**, **COSMO-2I-EPS**

ENSEMBLE SYSTEMS MAIN FEATURES	ECMWF ENS (global)	COSMO-2I-EPS (LAM used in Mistral project)
Integration domain		
Horizontal resolution (km)	18	2.2
Vertical resolution (ML)	91	65
Forecast range	240h (138h)	51h
Initial conditions	Ens 4Dvar + SVs	ETKF
Boundary conditions	/	COSMO-ME-EPS
Type of convection	Parameterized convection	Explicit convection
Ensemble size	50+1	20
Starting times (UTC)	00, 12 (06, 18)	21

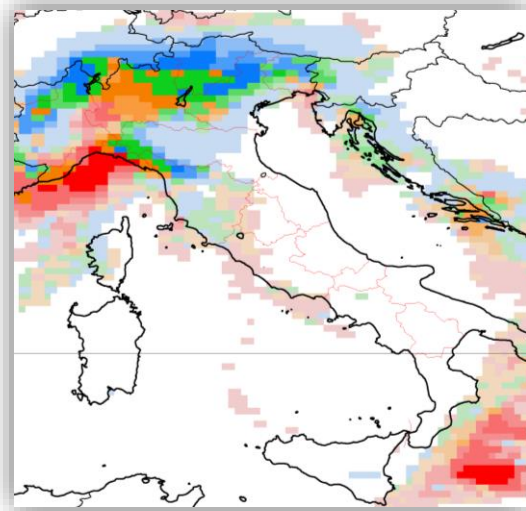

6h ecPoint-Rainfall post-processing

99th percentile
6-h precipitation

- A **statistical post-processing** system, that aims to **correct for physical aspects of rainfall generation** that are not well represented in the NWP model and that relate closely to error sources for point-based verification.

-sub-grid variability & gridscale biases are corrected for, both based on “**gridbox weather types**”;

Weather types for a day/lead time/ensemble member

scale-selective neighborhood method

Blake et al. (WEA, 2018)
Dey et al. (QJRMS 2016a, 2016b)

- compensate for there being **insufficient** limited area model ensemble members.
- It can **retain** at the finest scales **rainfall signals** when it is in **good agreement** between all the ensemble members (reliable at those scales): **orographically-forced rainfall**.
- It also can **spread out** the information from nearby gridboxes when we have **scattered showers** or some discrepancy in time or space of the arrival of a **front**

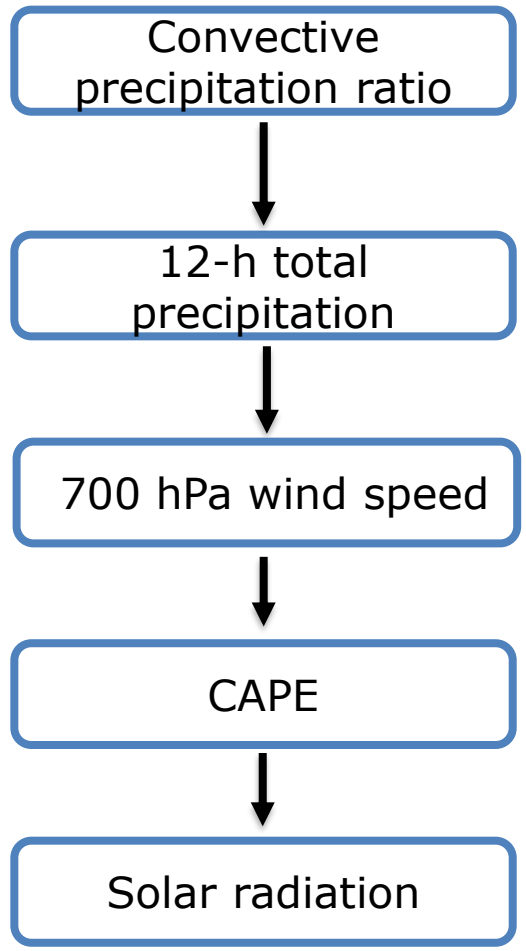

Scale agreement for a day/lead time for COSMO-21-EPS

At each grid-point, **SA** is the spatial scale at which 2 ensemble members are deemed “sufficiently” similar.

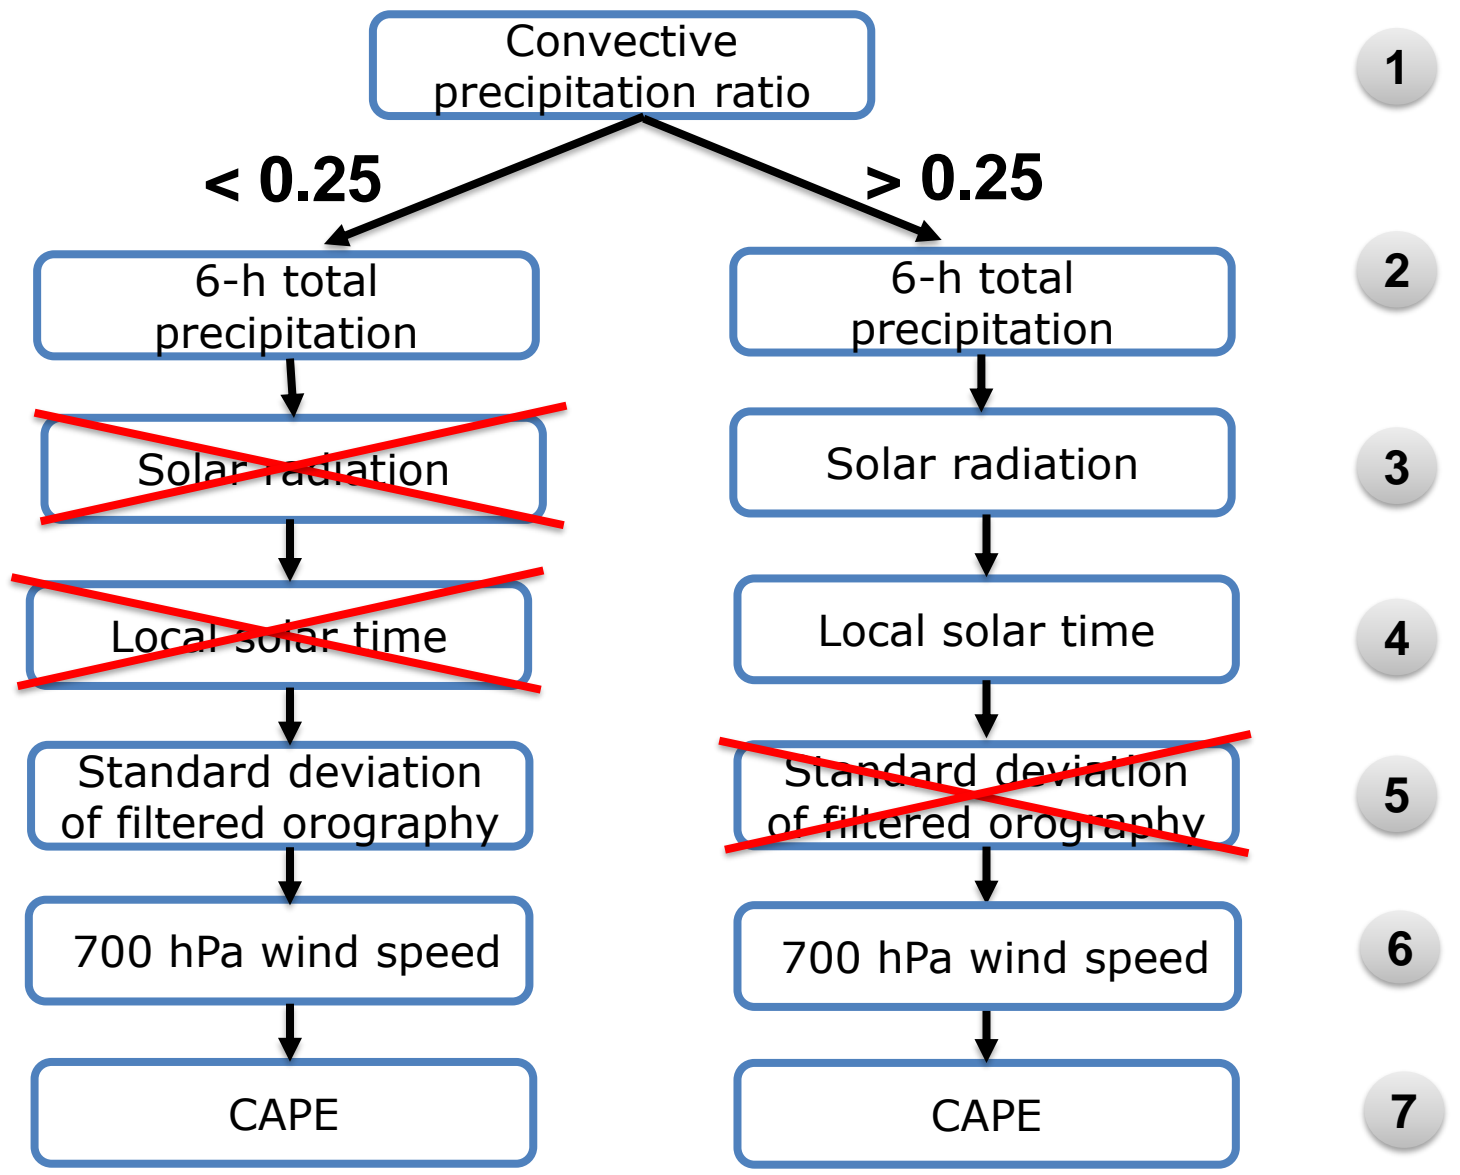

NEW!

ecPoint Rainfall 12-h

ecPoint Rainfall 6-h

DECISION TREE

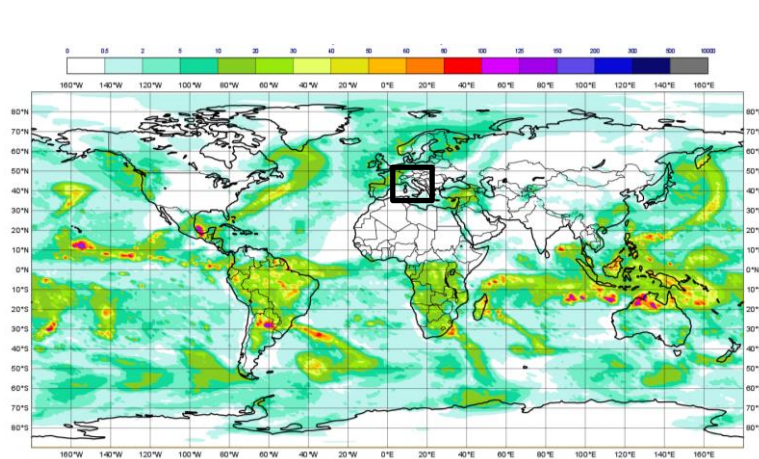

COSMO and ecPoint 6-h Rainfall blending

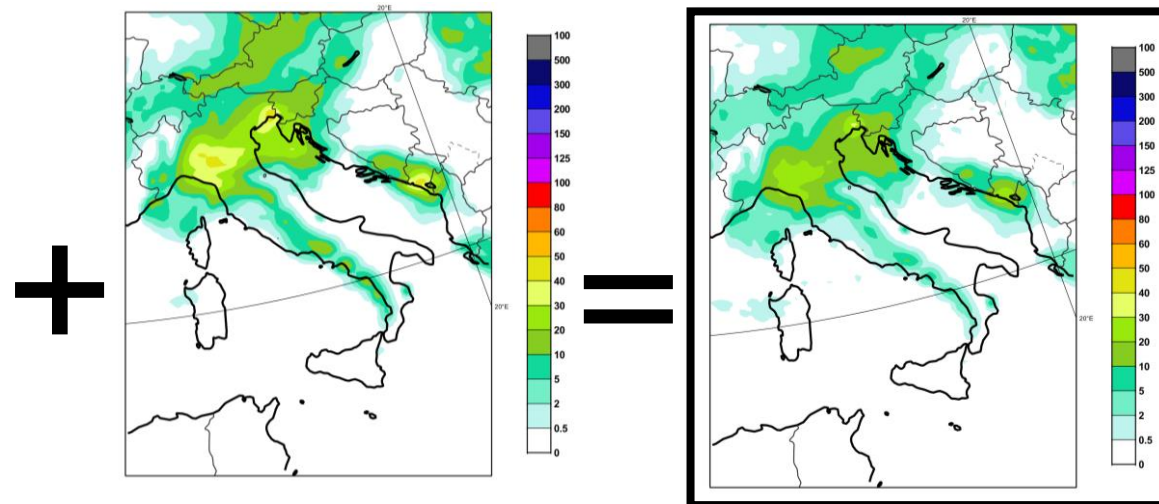

Combine the **most skilful aspects of the two systems** after applying different post-processings.

- All using the **CINECA supercomputer**.
- The final product will comprise **percentiles** (1, 2,..99) and **probabilities of exceeding** specific precipitation thresholds, for each COSMO gridbox.
- Lead times up to **48 h (the blending)** and **240 h** for the **ecPoint Rainfall 6-h**.

THE WEIGHTS OF EACH SYSTEM IN THE BLENDING WILL BE LEAD-TIME DEPENDANT

CONCLUSIONS

- Development and operational implementation of “COSMO post”, based on a scale-selective neighbour post-processing of COSMO-2I-EPS;
- Development and operational implementation of a global ecPoint-Rainfall 6h.
- The merging of COSMO post with ecPoint6h provides promising results as for the prediction of flash floods over Italy, specially in summer period, when flash floods are more likely to occur.
- Forecast products displayed on an operational basis on MISTRAL Portal: <https://meteohub.hpc.cineca.it>

Work in progress

- improve documentation;
- think about more sophisticated ways of blending (season related?);
