Evaluating climatic and soil water controls on evapotranspiration at two Amazonian rainforest sites

Rosie A. Fisher ^a ✉, Mathew Williams ^a, Maria de Lourdes Ruivo ^b, Antonio Lola de Costa ^c,
Patrick Meir ^a

- 2008: Amazonian soils have hugely different hydraulic properties than the standard pedo-transfer functions imply... (meaning they store **quite a lot less water**)
- AFAIK this is still true!

2002: Caxiuana, Brazil.

What is the Community Land Model?

The land surface of numerous **Earth System Models**

CESM, **NorESM**, CMCC, E3SM

Open source, open development, 'bottom-up'

Relatively advanced **process representation** (for a LSM)

Land tiling in the ('big leaf') CLM5

Landunit

Gridcell

CLM 5 LULCC for Natural PFT and Crop

What are "ancillary fields"?

We call them "**surface datasets**"

Used in CLM to provide information on properties of the land surface that are **prescribed** (input) to the model

Standard input maps

Details in
CLM5 tech

docs/](https://escomp.github.io/ctsm-docs/)

1. CLM5.0 User's Guide
2. CLM Technical Note
2.1. Introduction
2.2. Surface Characterization, Vertical Discretization, and Model Input Requirements
2.2.1. Surface Characterization
2.2.2. Vertical Discretization
2.2.3. Model Input Requirements

Surface Field	Resolution
Percent glacier	0.05°
Percent lake and lake depth	0.05°
Percent urban	0.05°
Percent plant functional types (PFTs)	0.05°
Monthly leaf and stem area index	0.5°
Canopy height (top, bottom)	0.5°
Soil color	0.5°
Percent sand, percent clay	0.083°
Soil organic matter density	0.083°
Maximum fractional saturated area	0.125°
Elevation	1km
Slope	1km
Biogenic Volatile Organic Compounds	0.5°
Crop Irrigation	0.083°
Managed crops	0.5°
Population density	0.5°
Gross domestic production	0.5°
Peat area fraction	0.5°
Peak month of agricultural waste burning	0.5°

Land Cover and Cropping Data

MODIS IGBP Land Cover

MODIS VCF Percent Tree

Climate Data

CRU Climate - Whittaker Biomes

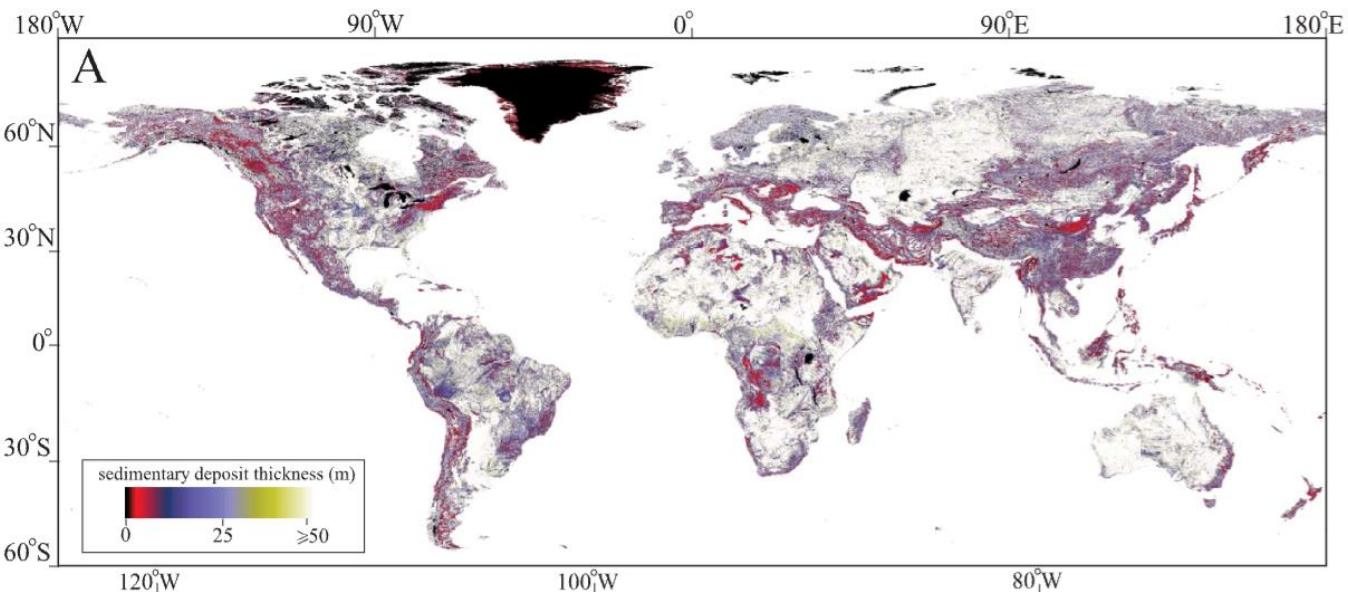

2000 - 2015

Leaf Area and Albedo Data

MODIS Maximum Annual Leaf Area Index (LAI)

2003 - 2015

Soils Data

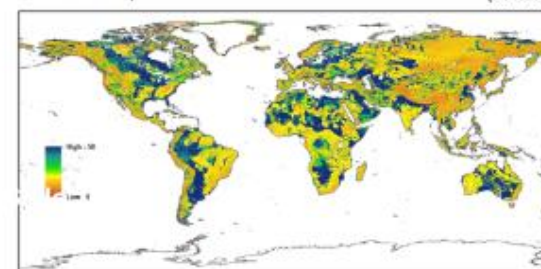

CLM5 Sand Content Top (avg 0 - 0.09m)

(%)

CLM5 Soil Depth

(meters)

Topography and River Data

CLM5 Elevation

(meters)

CLM5 MOSART River Network 0.5 Degrees

What is new since CLM5?

Standard input maps...?

These are still mostly the same 🙄

Land Cover and Cropping Data

What is new since CLM5?

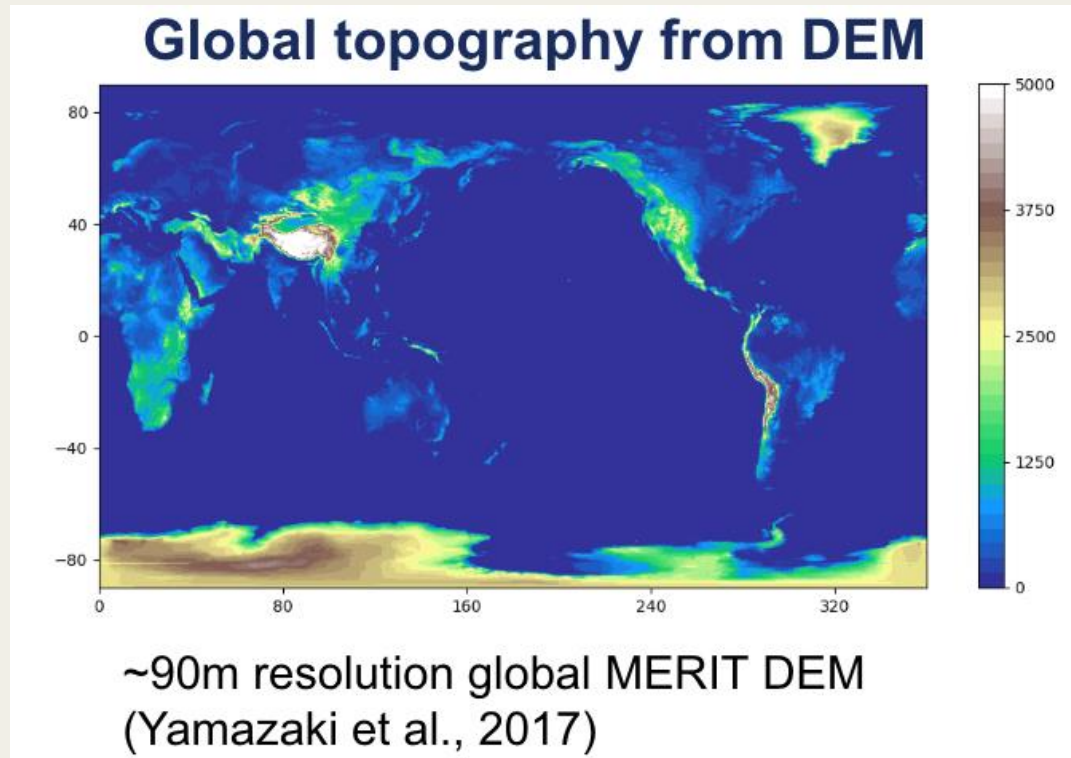

1. Hillslope Hydrology

Representing Intrahillslope Lateral Subsurface Flow in the Community Land Model

Sean C. Swenson¹ , Martyn Clark² , Ying Fan³ , David M. Lawrence¹ ,
and Justin Perket⁴

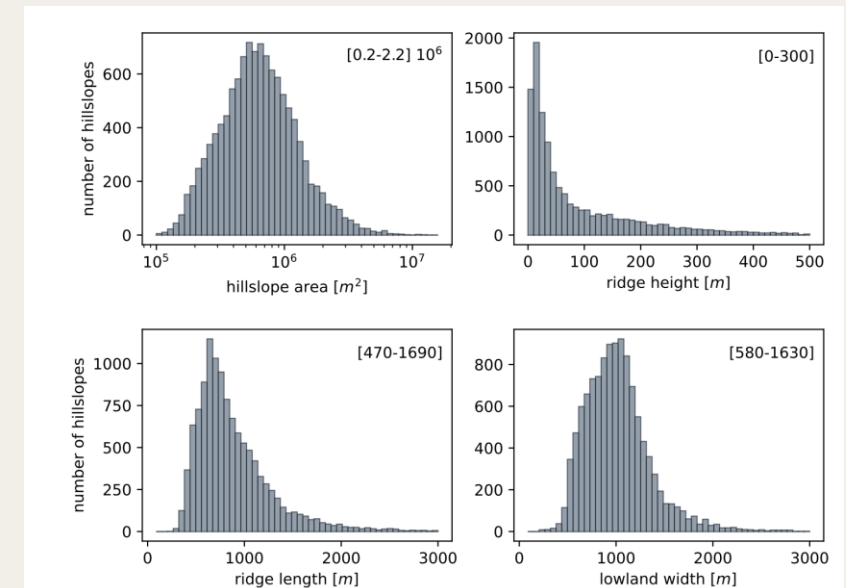

What is new since CLM5?

Each hillslope element (column) is defined by 6 parameters

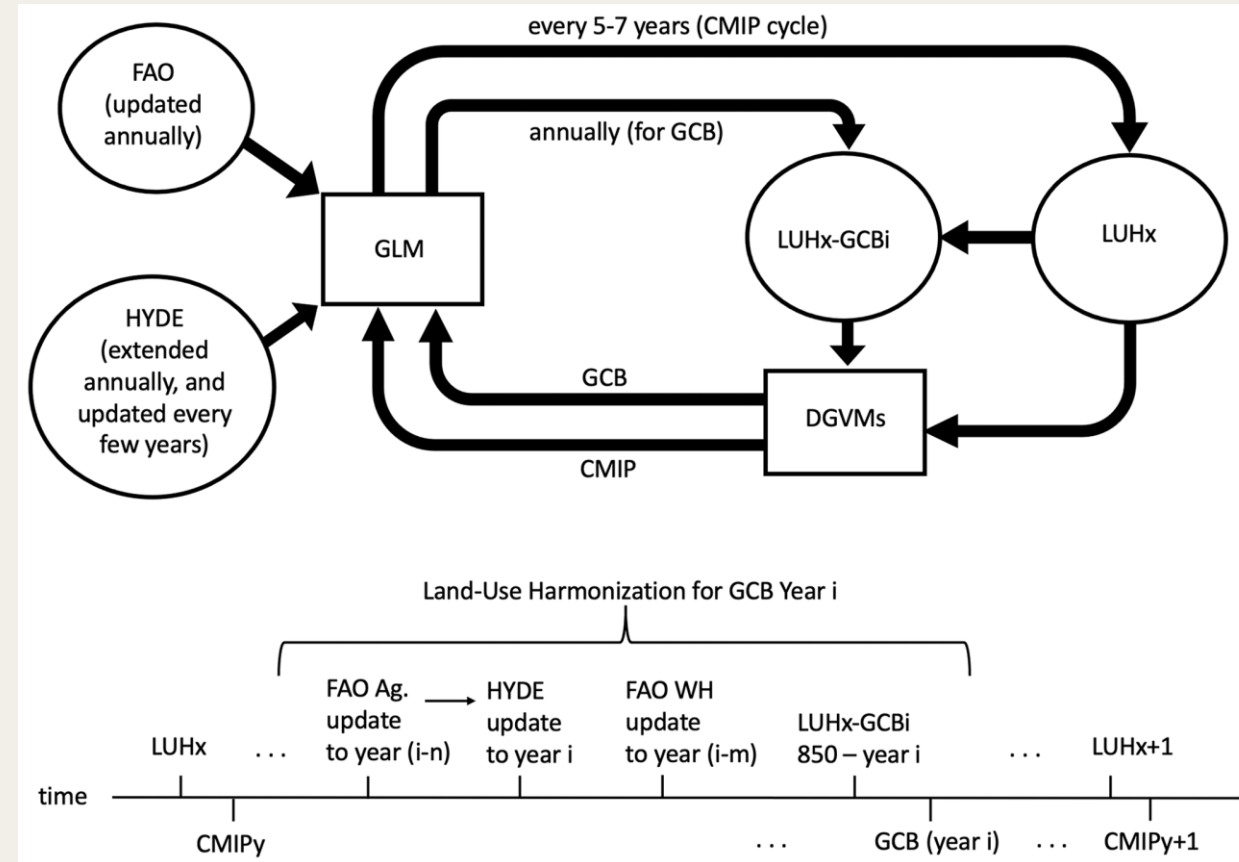

- Area (**a**)
- Width (**w**)
- Distance from channel (**d**)
- Height above nearest drainage (**h**)
- Slope (**α**)
- Aspect (**β**)

Swenson & Lawrence (in review)
extract these parameters from DEM

What is new since CLM5?

1. Hillslope Hydrology
2. New LUH3 **land use drivers** for **CMIP7**
 - Plantations
 - Biofuels
 - -> switchgrass & miscanthus

What is new since CLM5?

1. Hillslope Hydrology
2. New LUH3 **land use drivers** for **CMIP7**
 - Plantations
 - Biofuels
 - -> switchgrass & miscanthus.

3. FATES!

What is new since CLM5?

FATES (**F**unctionally **A**ssembled
Terrestrial **E**cosystem **S**imulator

<https://github.com/NGEET/fates>

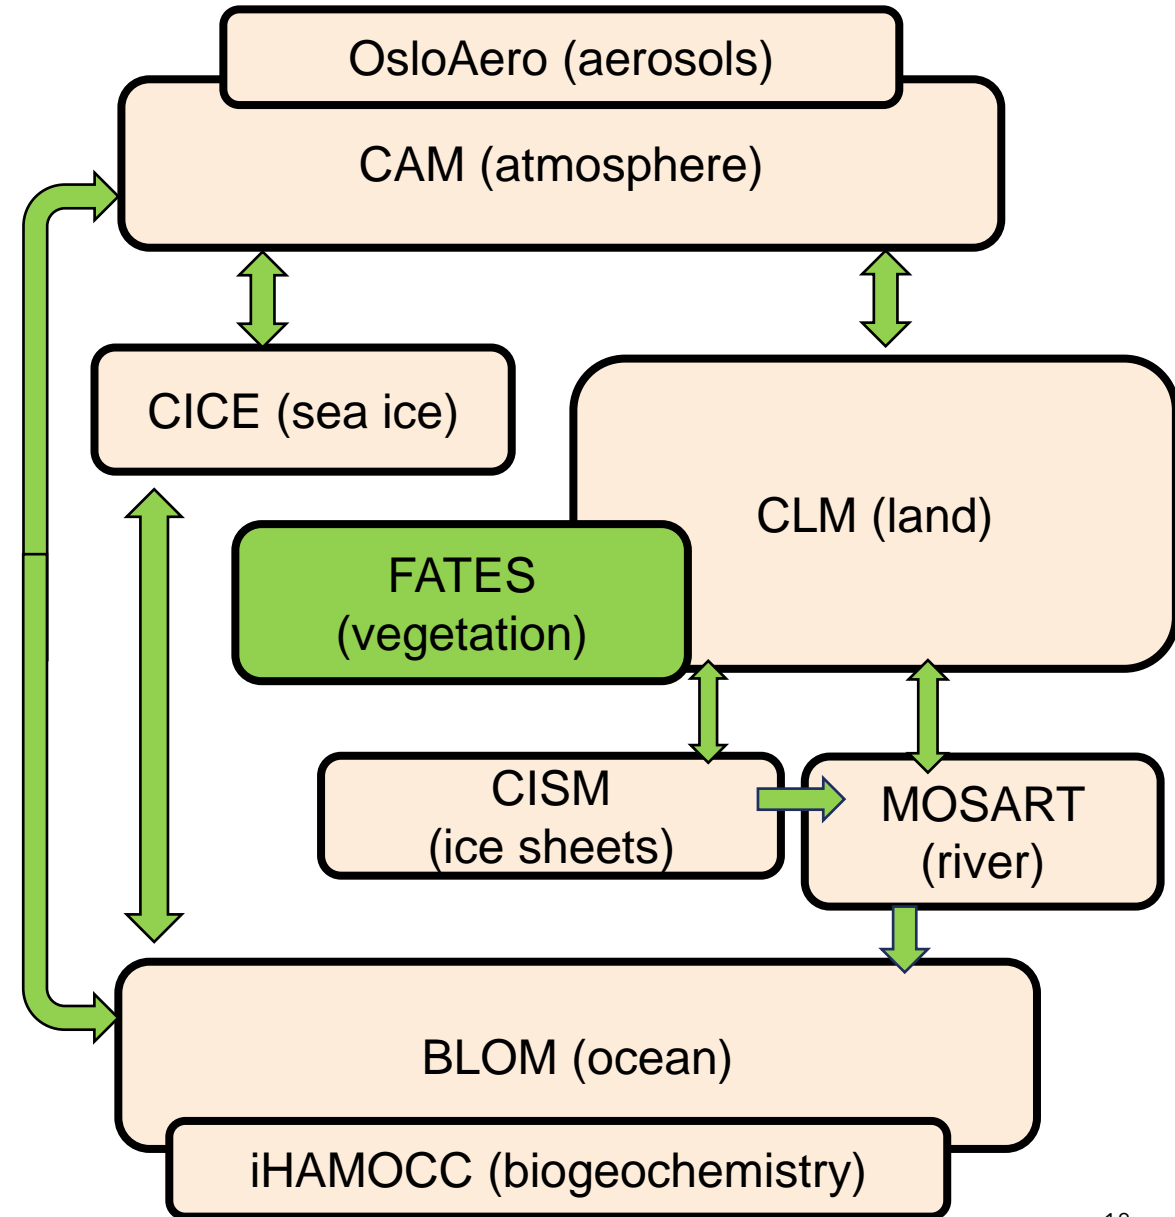

What is new since CLM5?

FATES includes:

- **Demographic** vegetation (size and age-structured) including **allometric growth**
- Plant **hydraulics**
- Plant **mortality** drivers (x7)
- **Nitrogen** and **Phosphorus** cycles
- Direct **land use change**, regrowth & **grazing**
- Multi-layer leaf **gas exchange**
- Flexible **PFT** representation
- **Multi-physics** representation of most things
- Multiple **reduced complexity** modes

The Norwegian Earth System Model

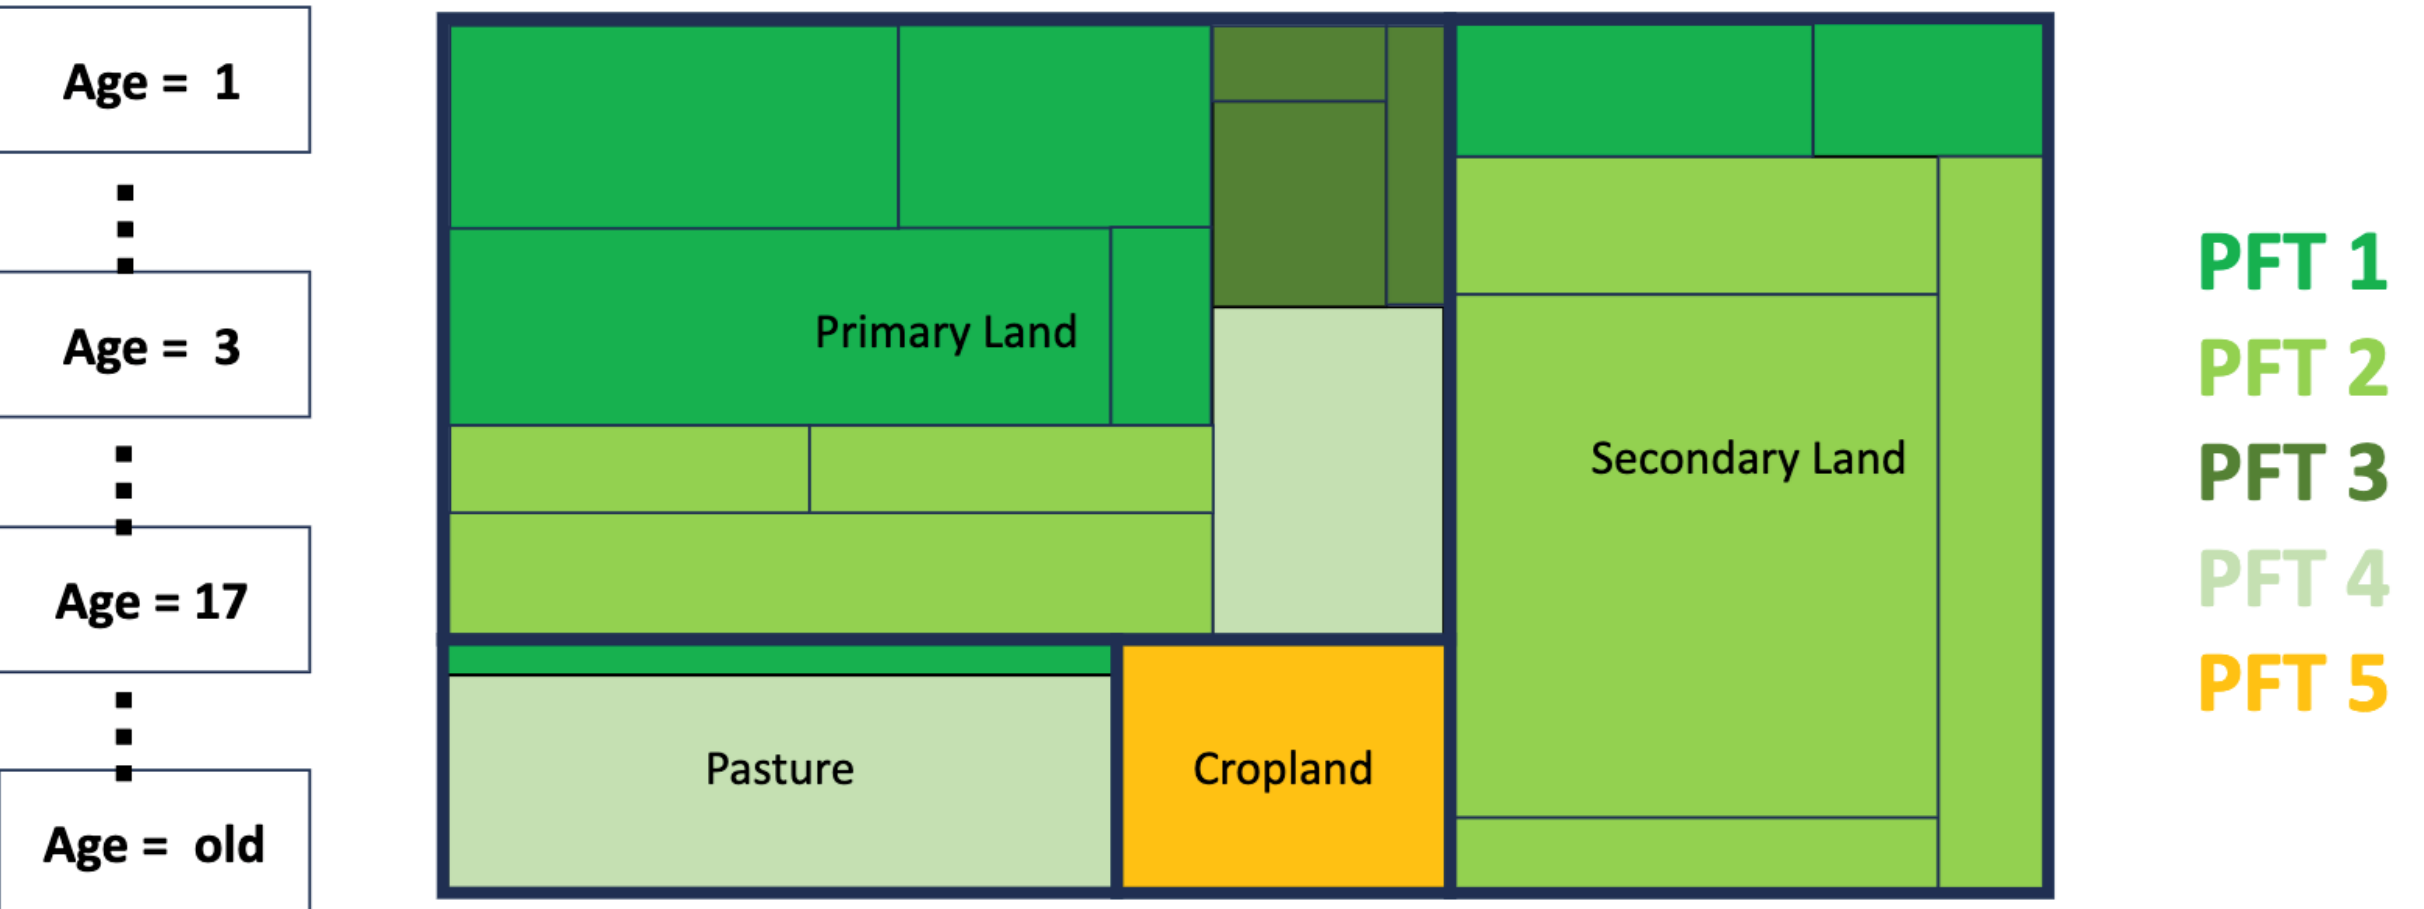

Does FATES need extra ancillaries?

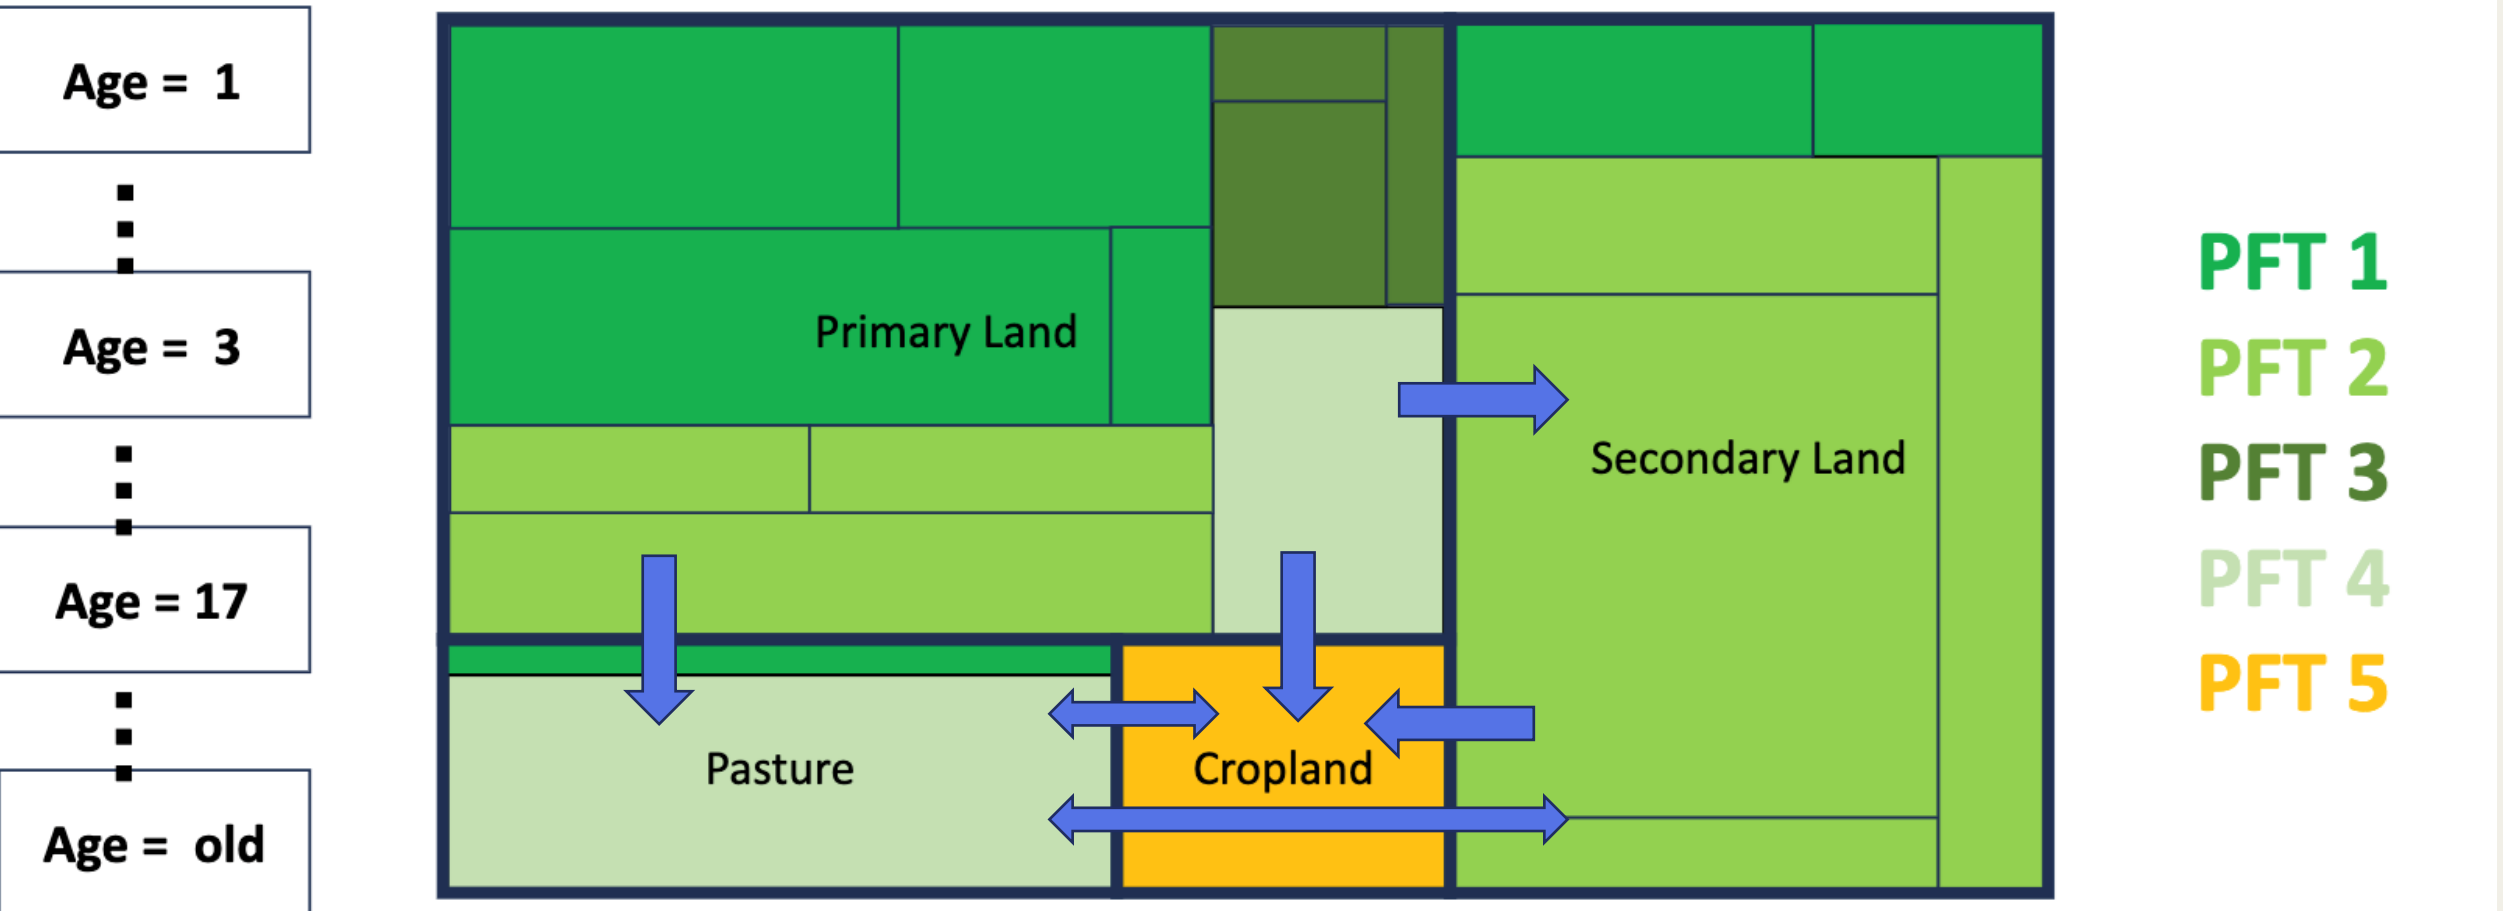

1. FATES can use same PFT maps as CLM (but can **add extraplant diversity** if drivers permit)
2. It can **represent direct land use transitions** from LUH2/3 (harvest, deforestation, abandonment)
3. We have made **new tools** to directly ingest these data into FATES

FATES land use representation

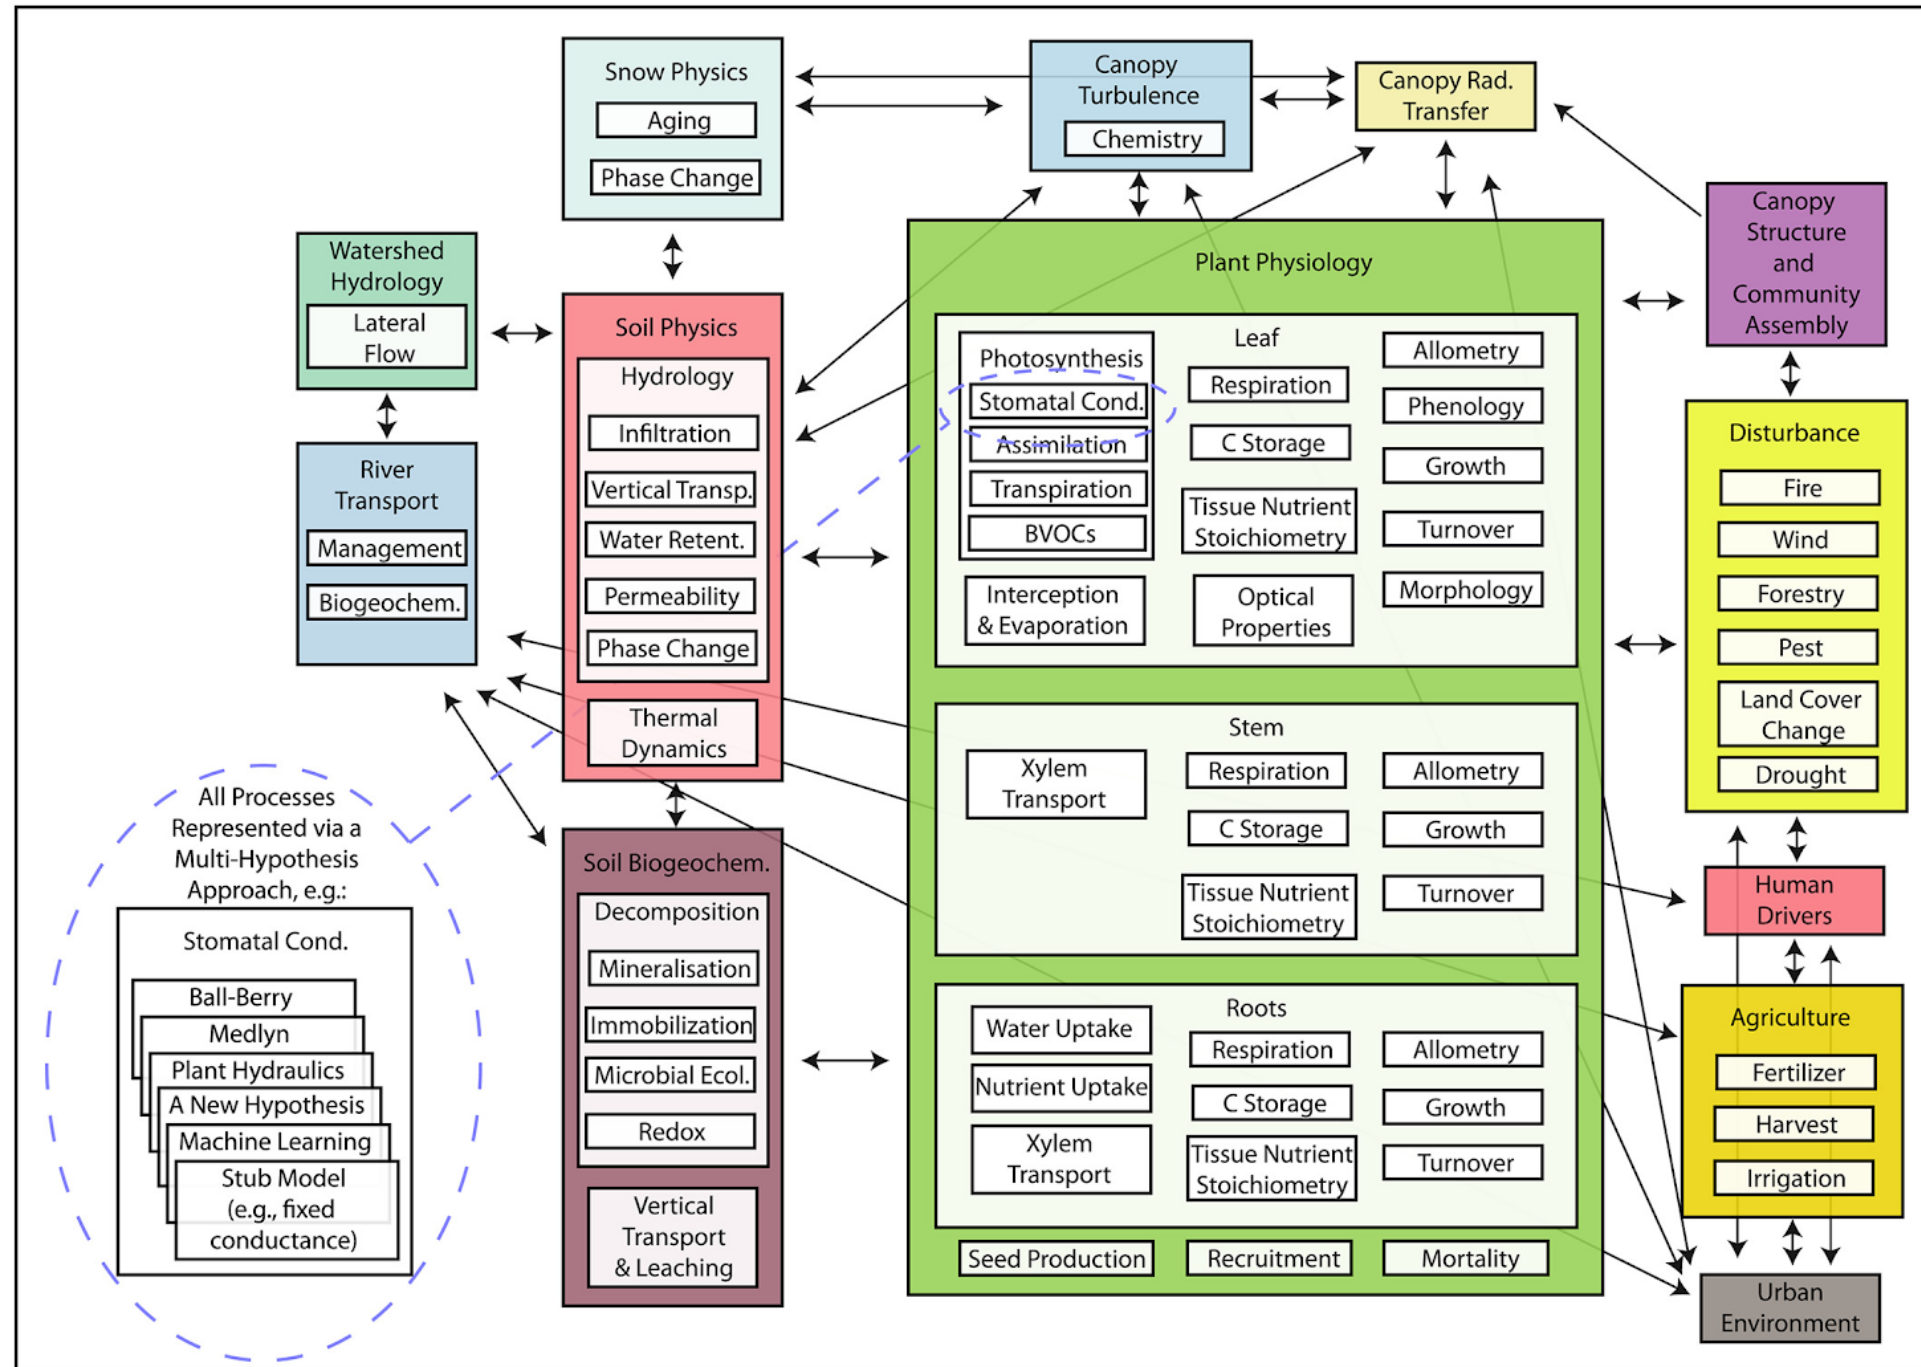

FATES land use transitions

Land surface models are **tremendously complex**

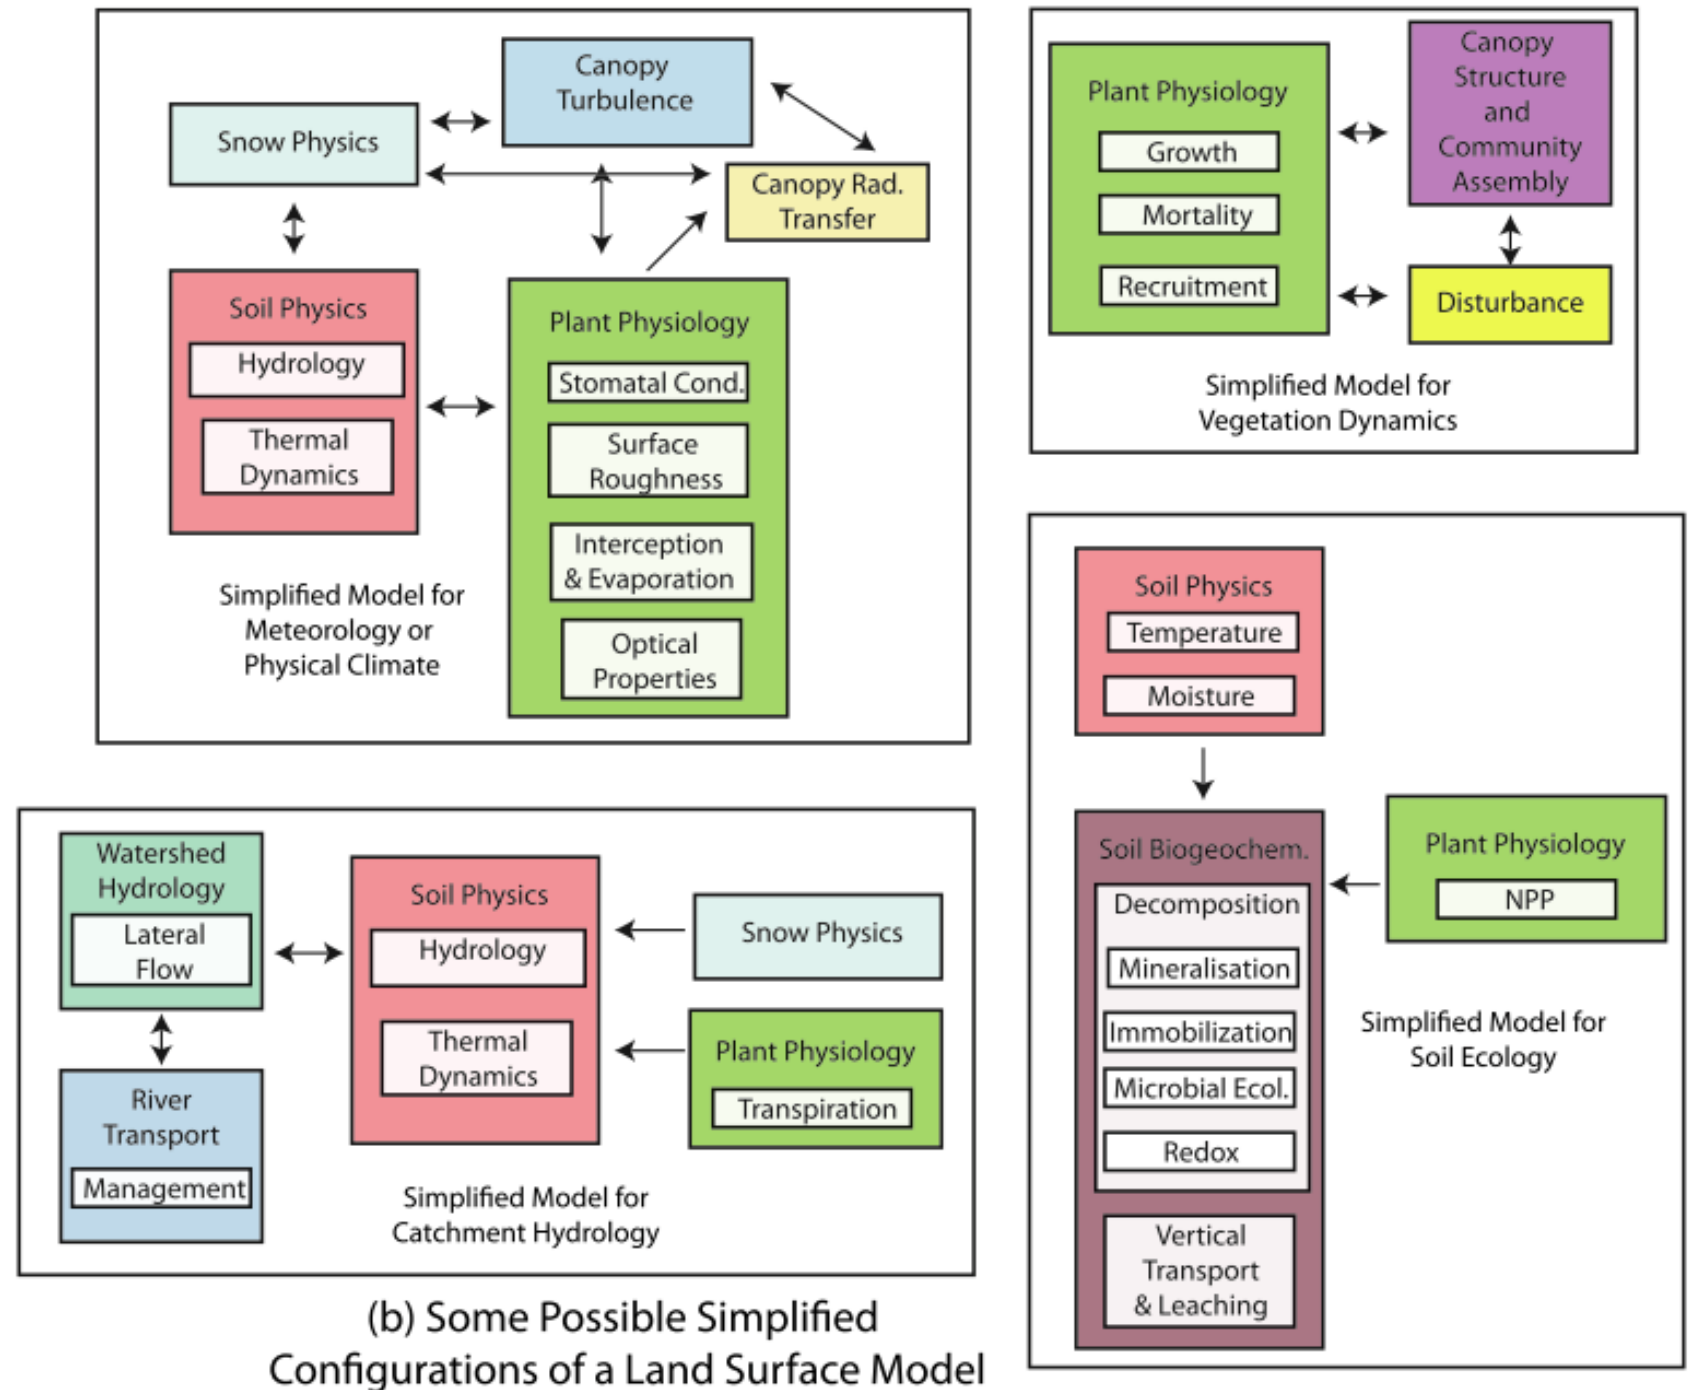

This makes **calibration** (i.e. emulator-based calibration efforts) **hard/uninformative**.

(a) Process Schematic of a Possible Full-Complexity Configuration of a Land Surface Model

A '**modular complexity**' approach to reducing dimensionality...

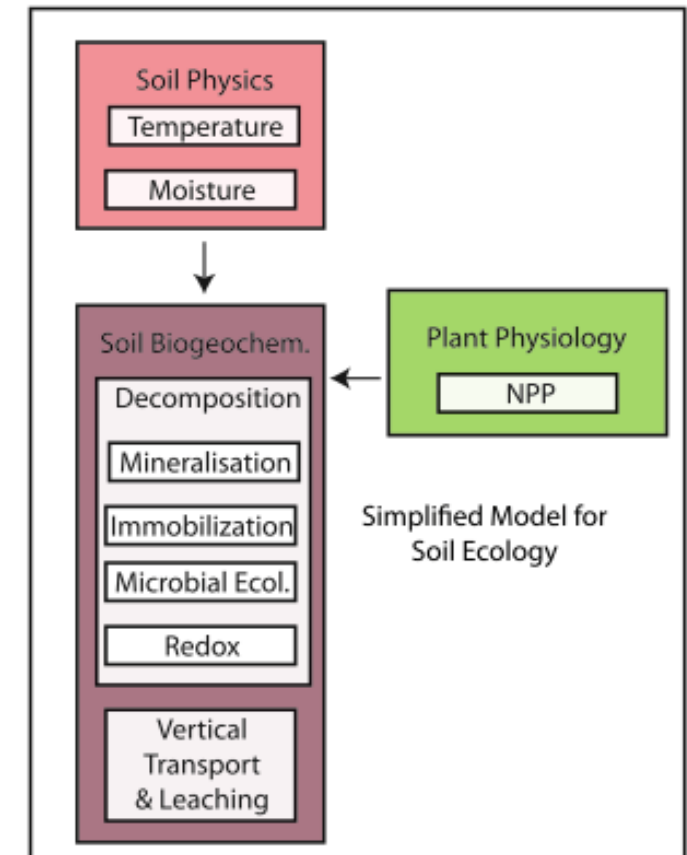

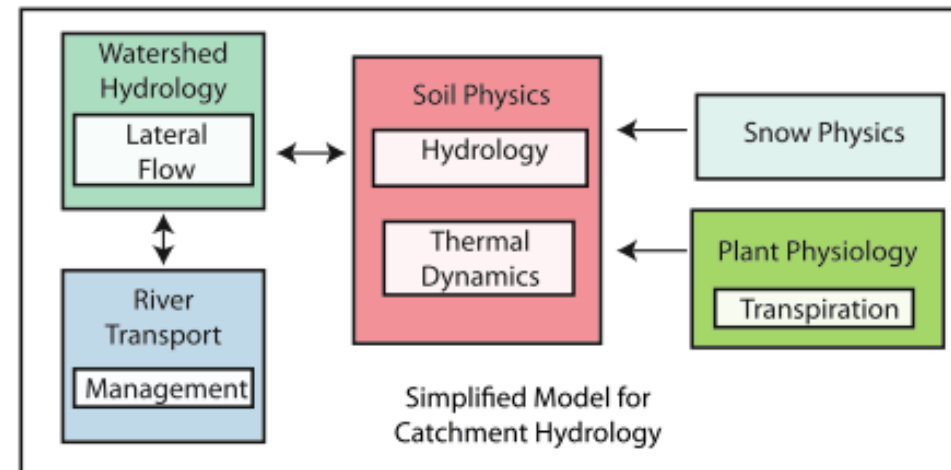

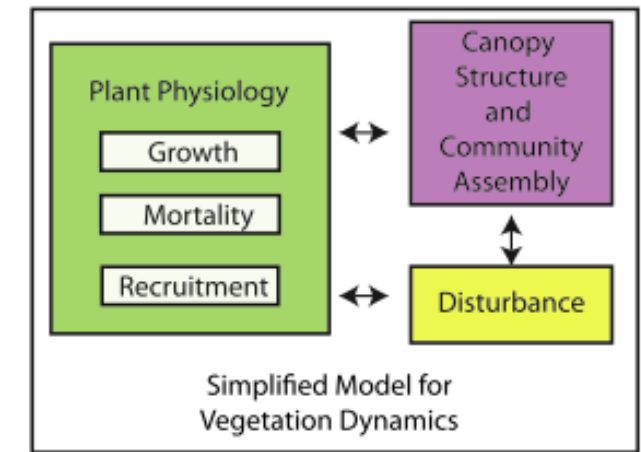

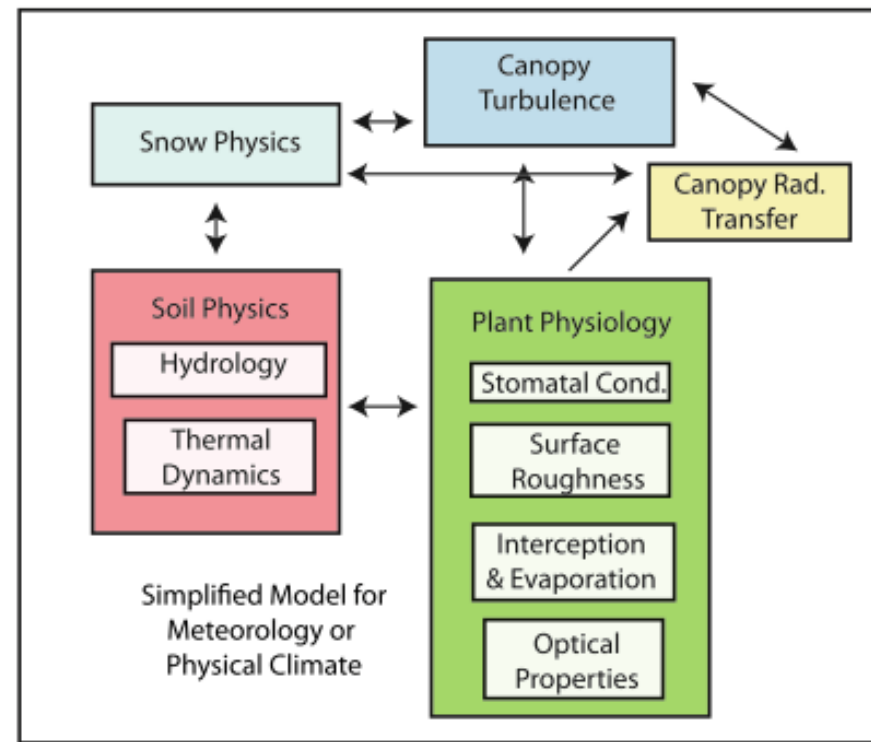

Driving the model with additional observations (ancillaries?) to **reduce complexity**.

A 'modular complexity' approach to reducing dimensionality...

Possible extra ancillaries

Leaf Area Index
Canopy Structure
Burned Area/fire emissions
Tree growth & mortality
Soil moisture

(b) Some Possible Simplified Configurations of a Land Surface Model

SUMMARY

1. Considerable **effort** gone into representation of **land use** and **hydrological** heterogeneity in CLM
2. **Not much work** on the more standard input fields, esp **soils**
3. **Introduction of**

°CICERO

esm
Earth System
Models for
the future **2025**

Thank you
