

# Hybrid Physics Based - Machine Learning approaches for weather prediction based on spectral nudging

Inna Polichtchouk

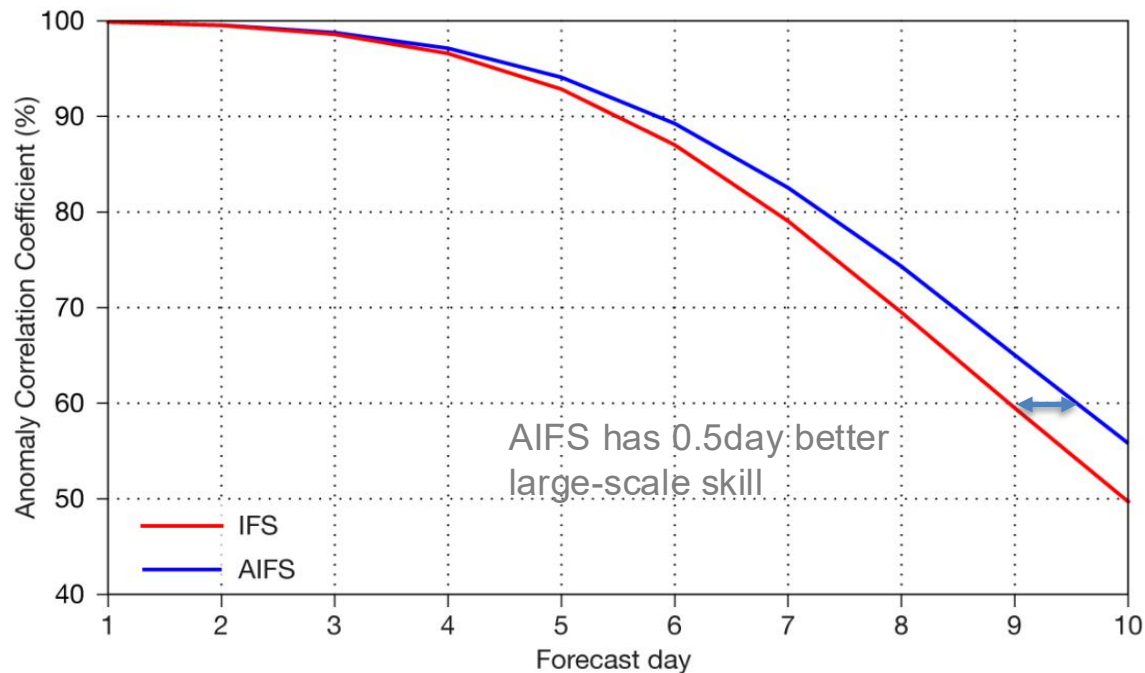

April 2026, NM Training Course

# We have IFS-CF physics-based forecasts..... and we have AIFS-Single machine learning forecasts

# Strengths and weaknesses of AIFS-Single

- AIFS-Single considerably better at forecasting large scales than IFS.
- But AIFS-Single produces overly smooth smaller scales and under-estimates storm intensities.
- AIFS-Single very cheap to run but does not produce all the variables forecasters use/need.

ACC for NH Z@500hPa from Lang et al. (2024a)

IFS-CF

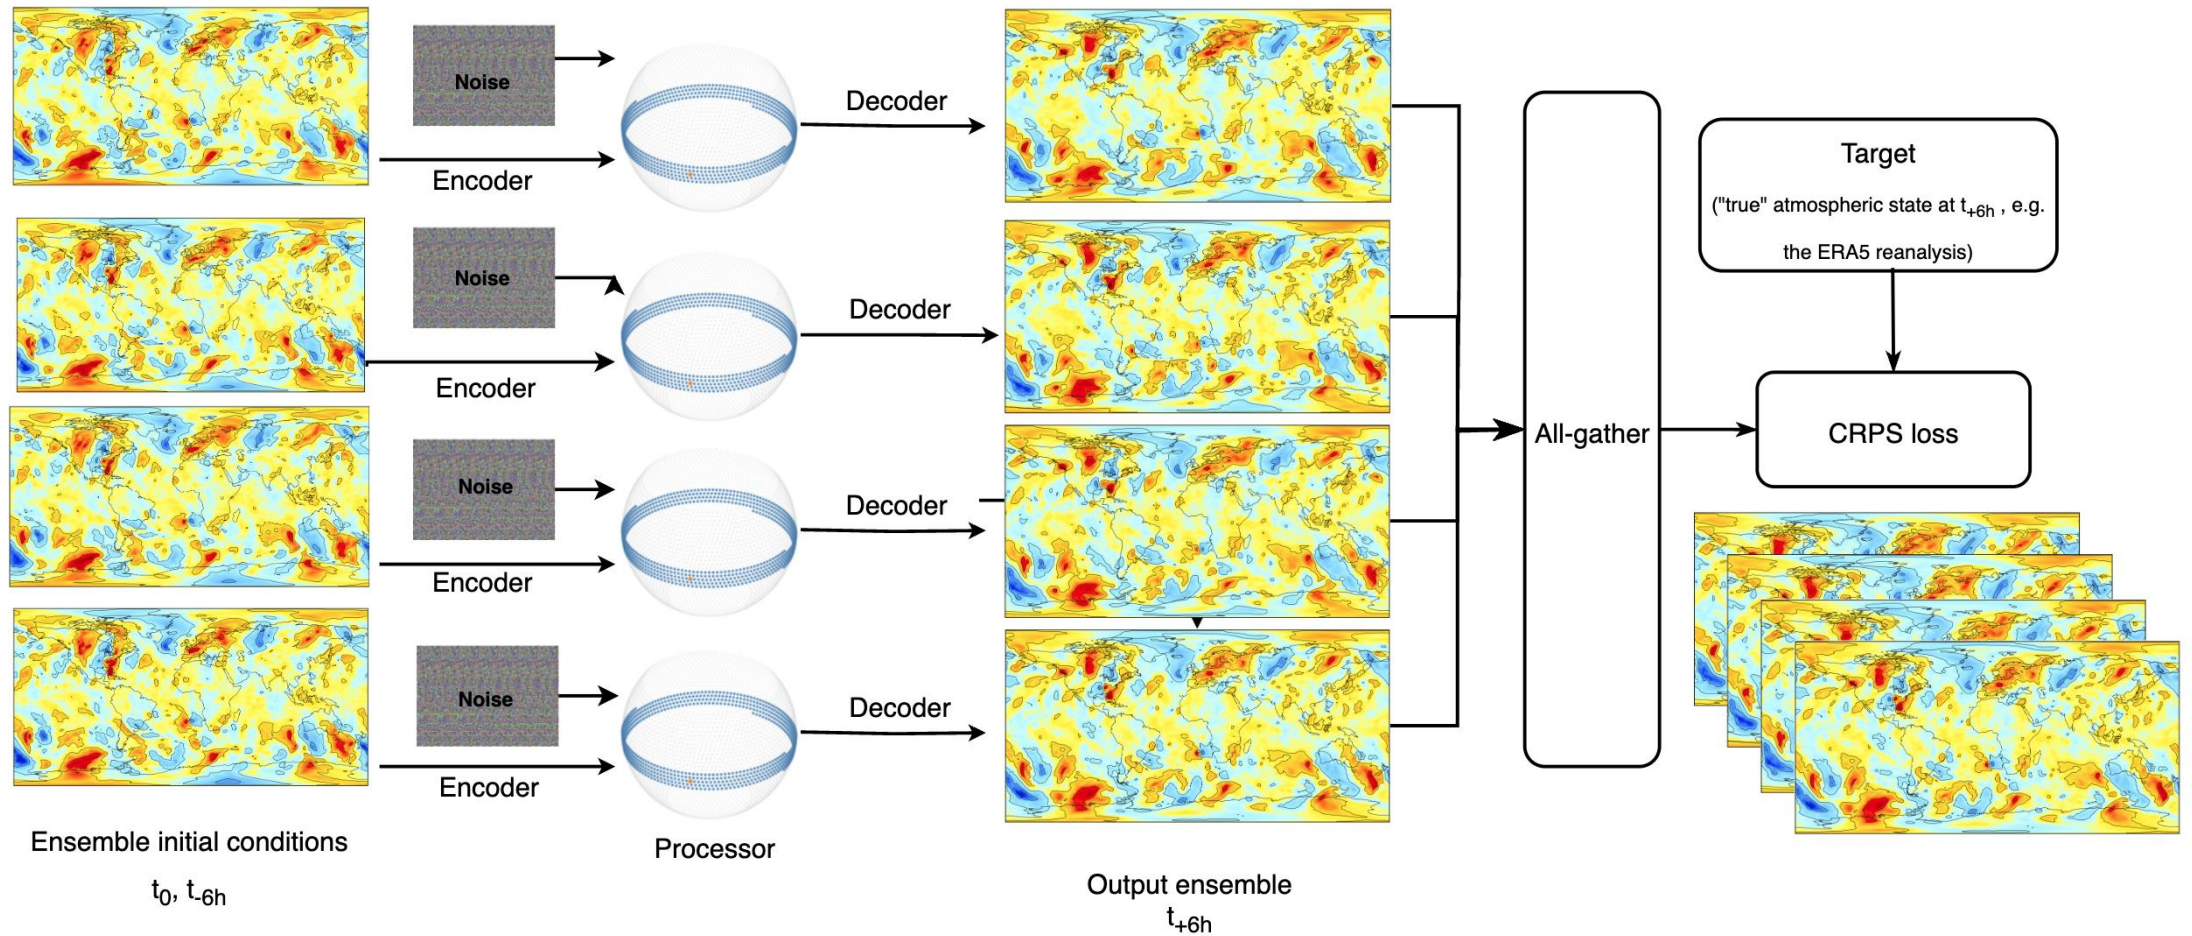

(b)

AIFS-Single

Lang et al. (2024b)

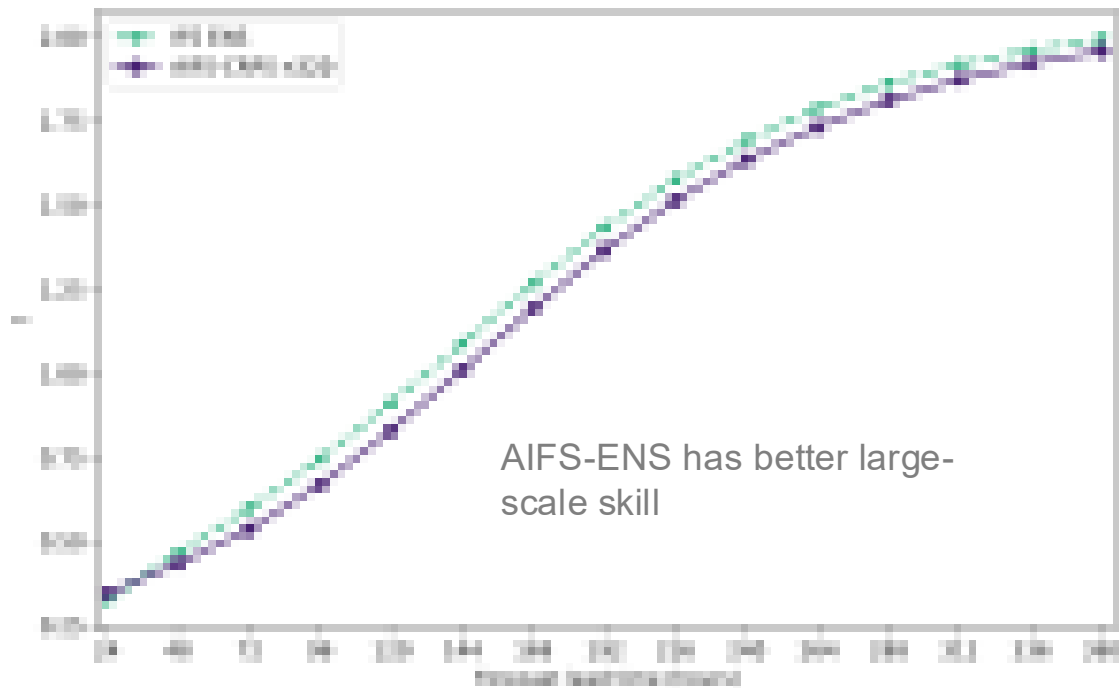

# We have IFS-ENS physics-based forecasts... and we have AIFS-ENS machine learning forecasts

Lang et al. (2024b)  
<https://arxiv.org/abs/2412.15832>

# Strengths and weaknesses of AIFS-ENS

- AIFS-ENS also considerably better at forecasting large scales than IFS-ENS.
- AIFS-ENS does not suffer from smoothing, but still at lower resolution than IFS-ENS (N320 vs. TCo1279)
- AIFS-ENS cheap to run but does not produce all the variables forecasters use/need.

CRPS for NH T@850hPa from Lang et al. (2024b)

IFS-ENS

AIFS-ENS

## Question:

**Can we combine AIFS and IFS to retain AIFS's large-scale skill while preserving realistic small-scale structure and full IFS outputs?**

**Yes, by creating a hybrid model via spectral nudging**

# How to do this?

- Use spectral nudging to bespoke AIFS models that predict fields on IFS model levels.
- Take AIFS-Single and AIFS-ENS forecasts and spectrally nudge IFS-CF and IFS-ENS to them. Tv and VOR nudged up to total wavenumber T21 in the **troposphere**. Like Hussain et al. (2024) @ECCC
- **Pros:** A) Small-scales not damped.  
B) Very cheap (to develop & forecast run-time).  
C) Does not need to be developed for each cycle.  
D) Retains better physical consistency of a physics-based model

# RECALL FROM MONDAY

## Spectral vs. grid-point representation in the IFS dynamical core

- **Derivatives, dissipation and semi-implicit solver** calculated in **spectral** space. Only VOR, DIV,  $T_v$ ,  $\Phi$  and  $p_s$  have spectral representations.

→ The only prognostic variables that can be spectrally nudged are VOR, DIV,  $T_v$  and  $p_s$

$$\frac{D\mathbf{V}}{Dt} + f\mathbf{k} \times \mathbf{V} + \nabla_h \Phi + R_d T_V \nabla_h \ln p = P_V + K_V,$$

$$\frac{DT}{Dt} - \frac{\kappa T_V \omega}{[1 + (\delta - 1)q]p} = P_T + K_T,$$

$$\frac{\partial}{\partial t} \left( \frac{\partial p}{\partial \eta} \right) + \nabla_h \cdot \left( \mathbf{V} \frac{\partial p}{\partial \eta} \right) + \frac{\partial}{\partial \eta} \left( \dot{\eta} \frac{\partial p}{\partial \eta} \right) = 0,$$

$$\frac{Dq}{Dt} = P_q,$$

$$\frac{\partial \Phi}{\partial \eta} = -R_d T_V \frac{\partial \ln p}{\partial \eta},$$

$$T_V = T \left[ 1 + \left( \frac{R}{R_d} - 1 \right) q \right]$$

# Kinetic energy spectra

- Small scales are indeed retained in the hybrid model.

Deterministic

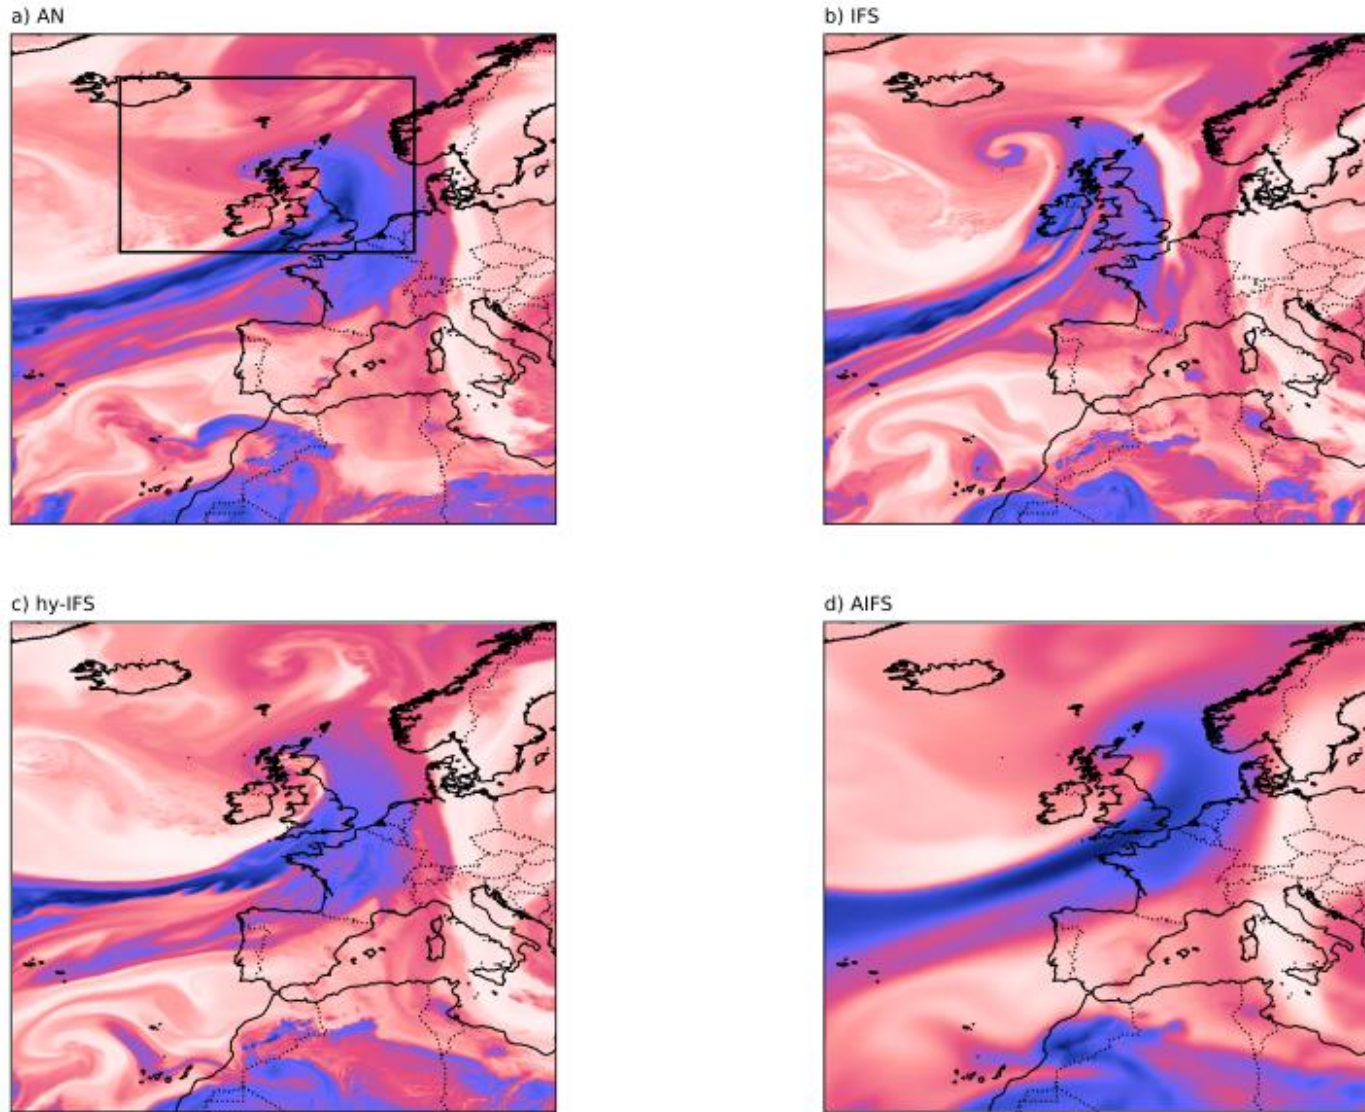

Ensemble

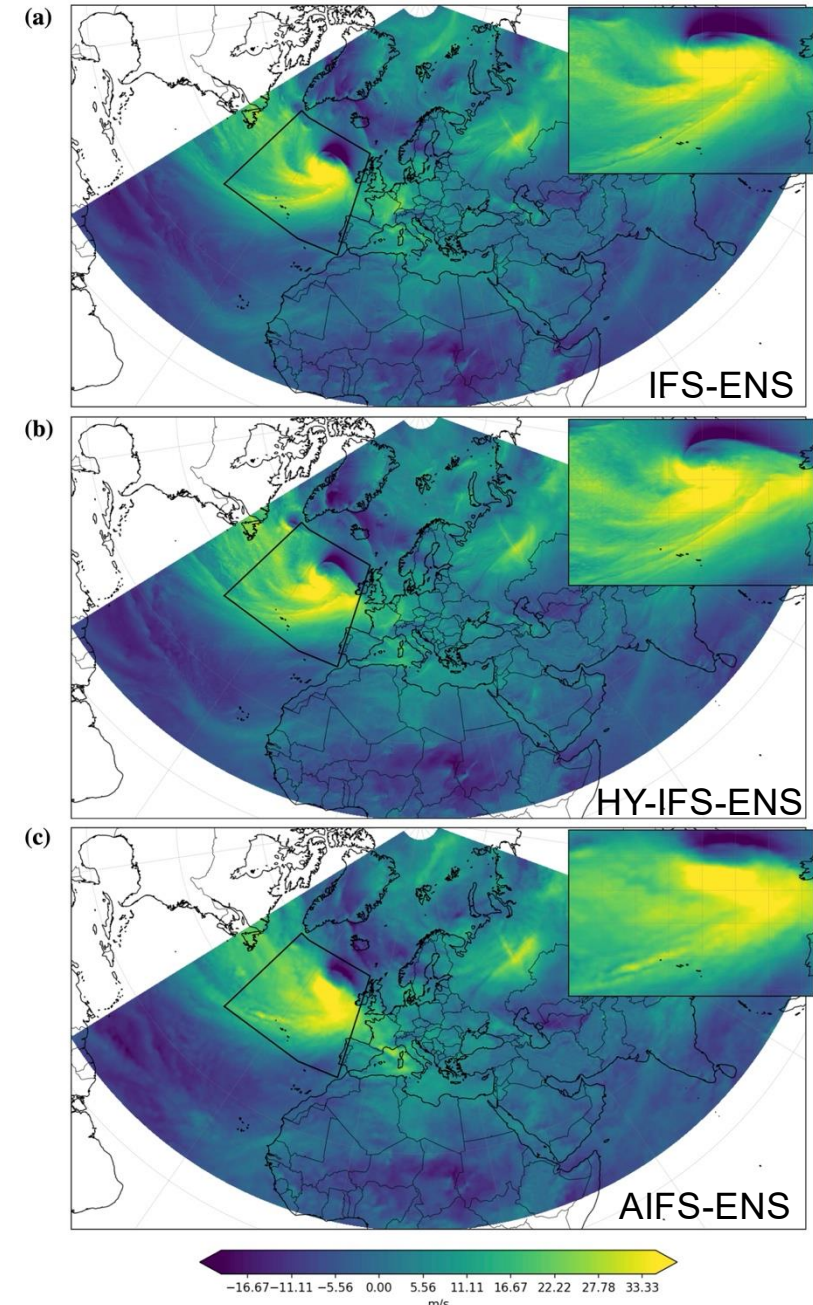

# Case studies also support this

Storm Amy in deterministic setup

Storm Eowyn in ENS setup

# Large-scale skill improvements

## hy-IFS-CF vs IFS-CF

## hy-IFS-ENS vs IFS-ENS

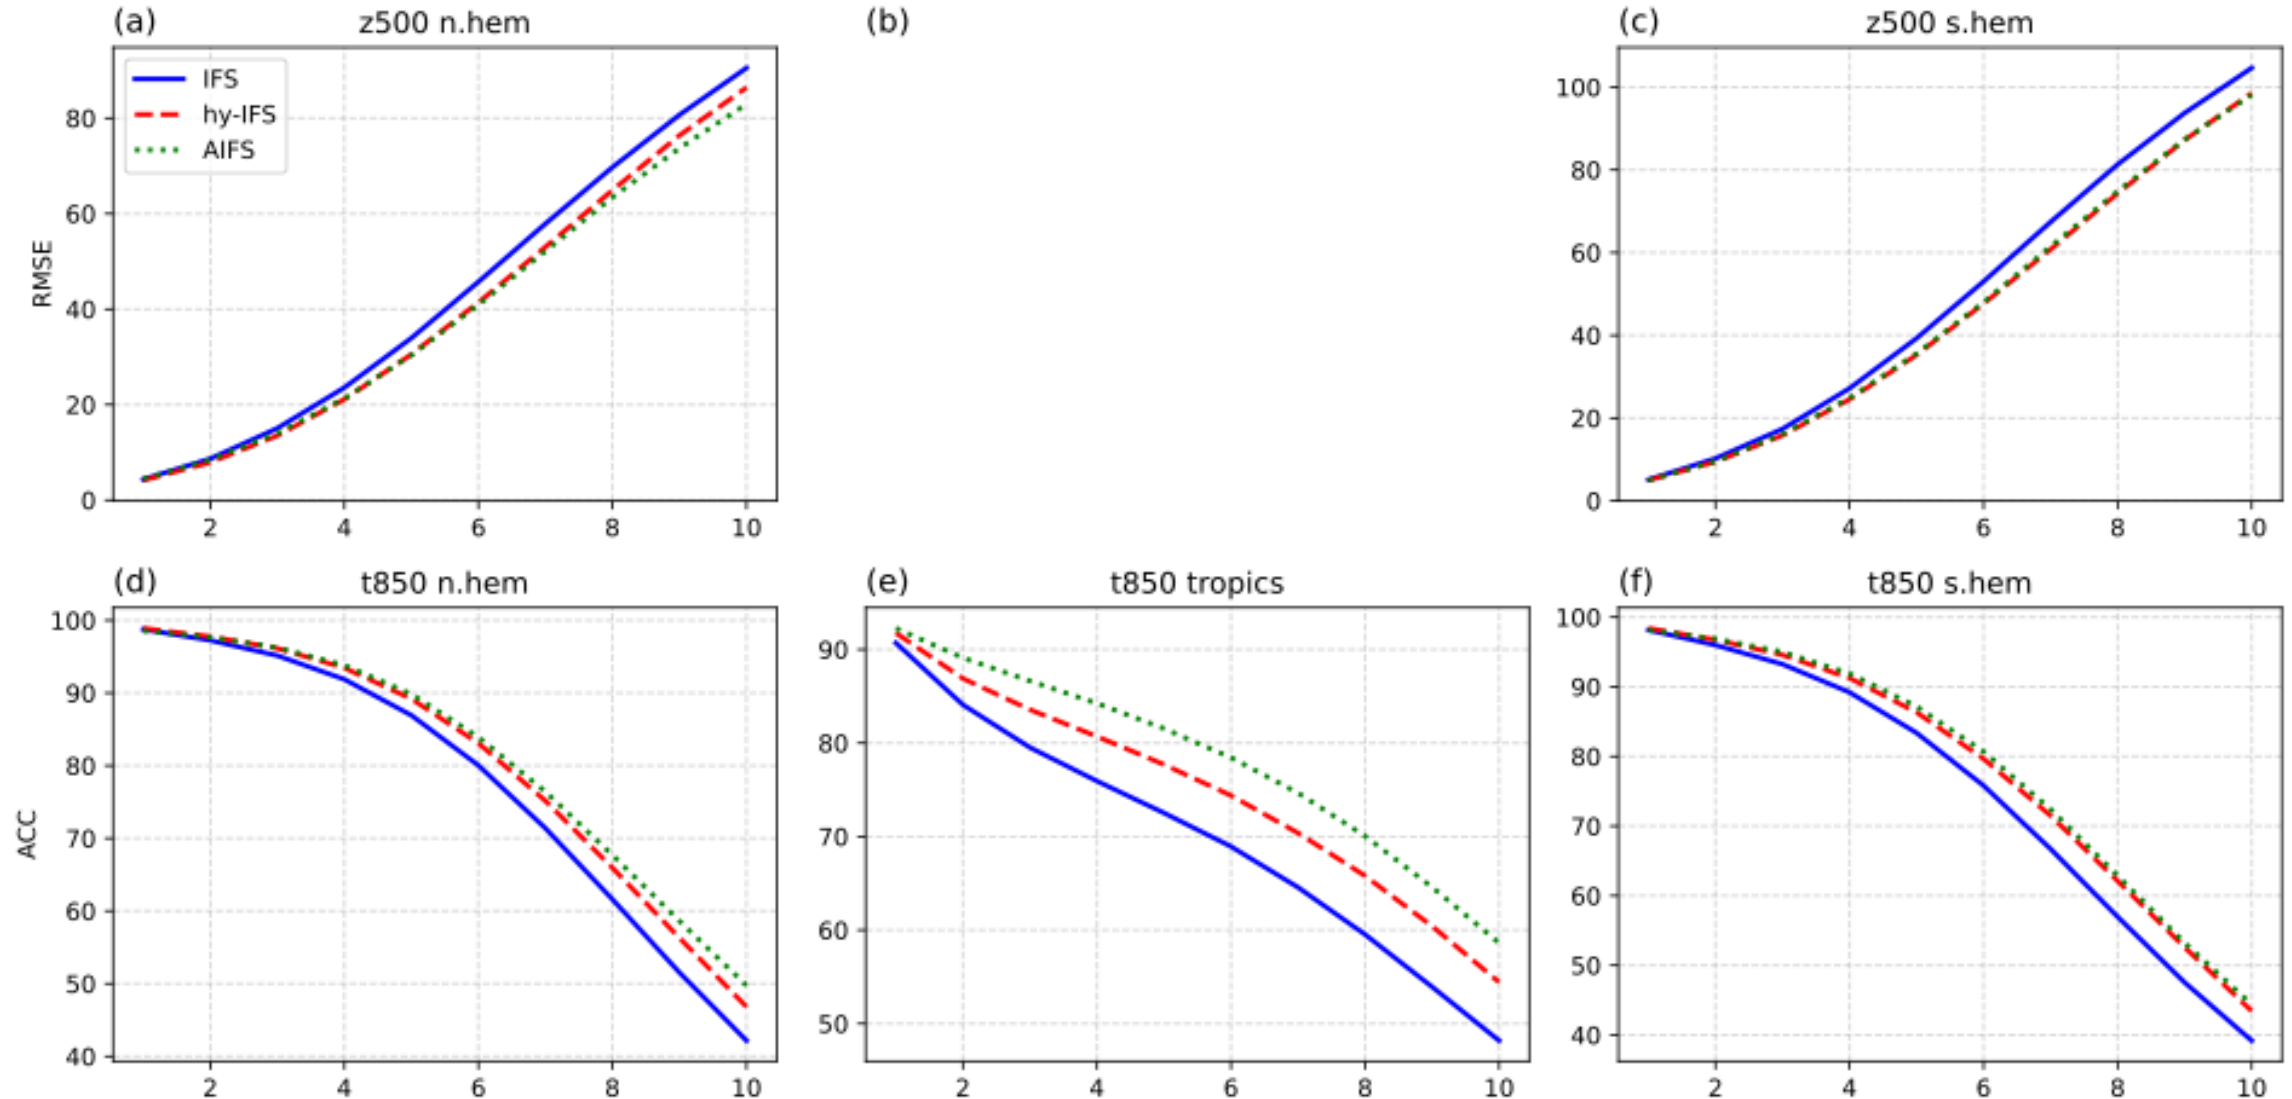

Hybrid worse

Hybrid better

# Large-scale skill improvements: Control (=deterministic)

- Upper air forecast skill translated from AIFS-Single to the hybrid model almost entirely

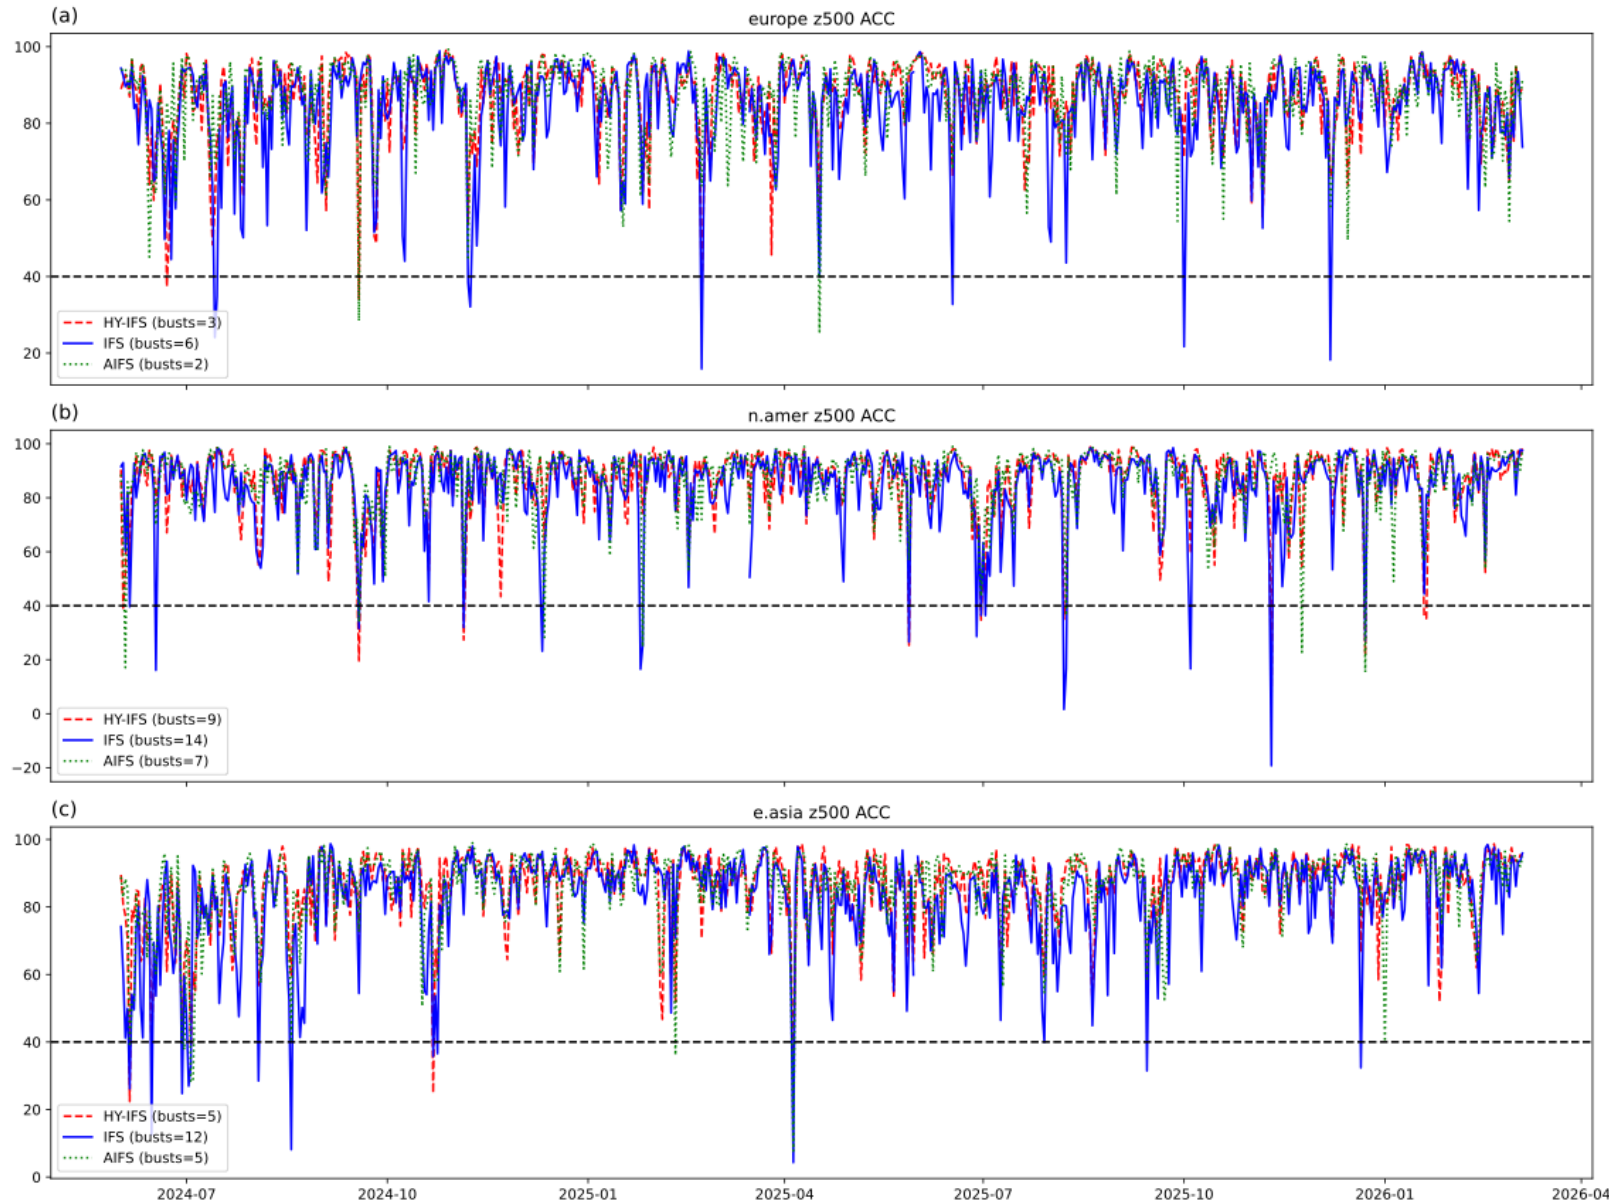

# Large-scale skill improvements: Control (=deterministic)

- Surface variable forecast skill also improved significantly, even though surface variables not directly nudged.
- Hybrid has best forecasts for 10m winds, but AIFS-Single still outperforms on 2m temperature and precipitation.

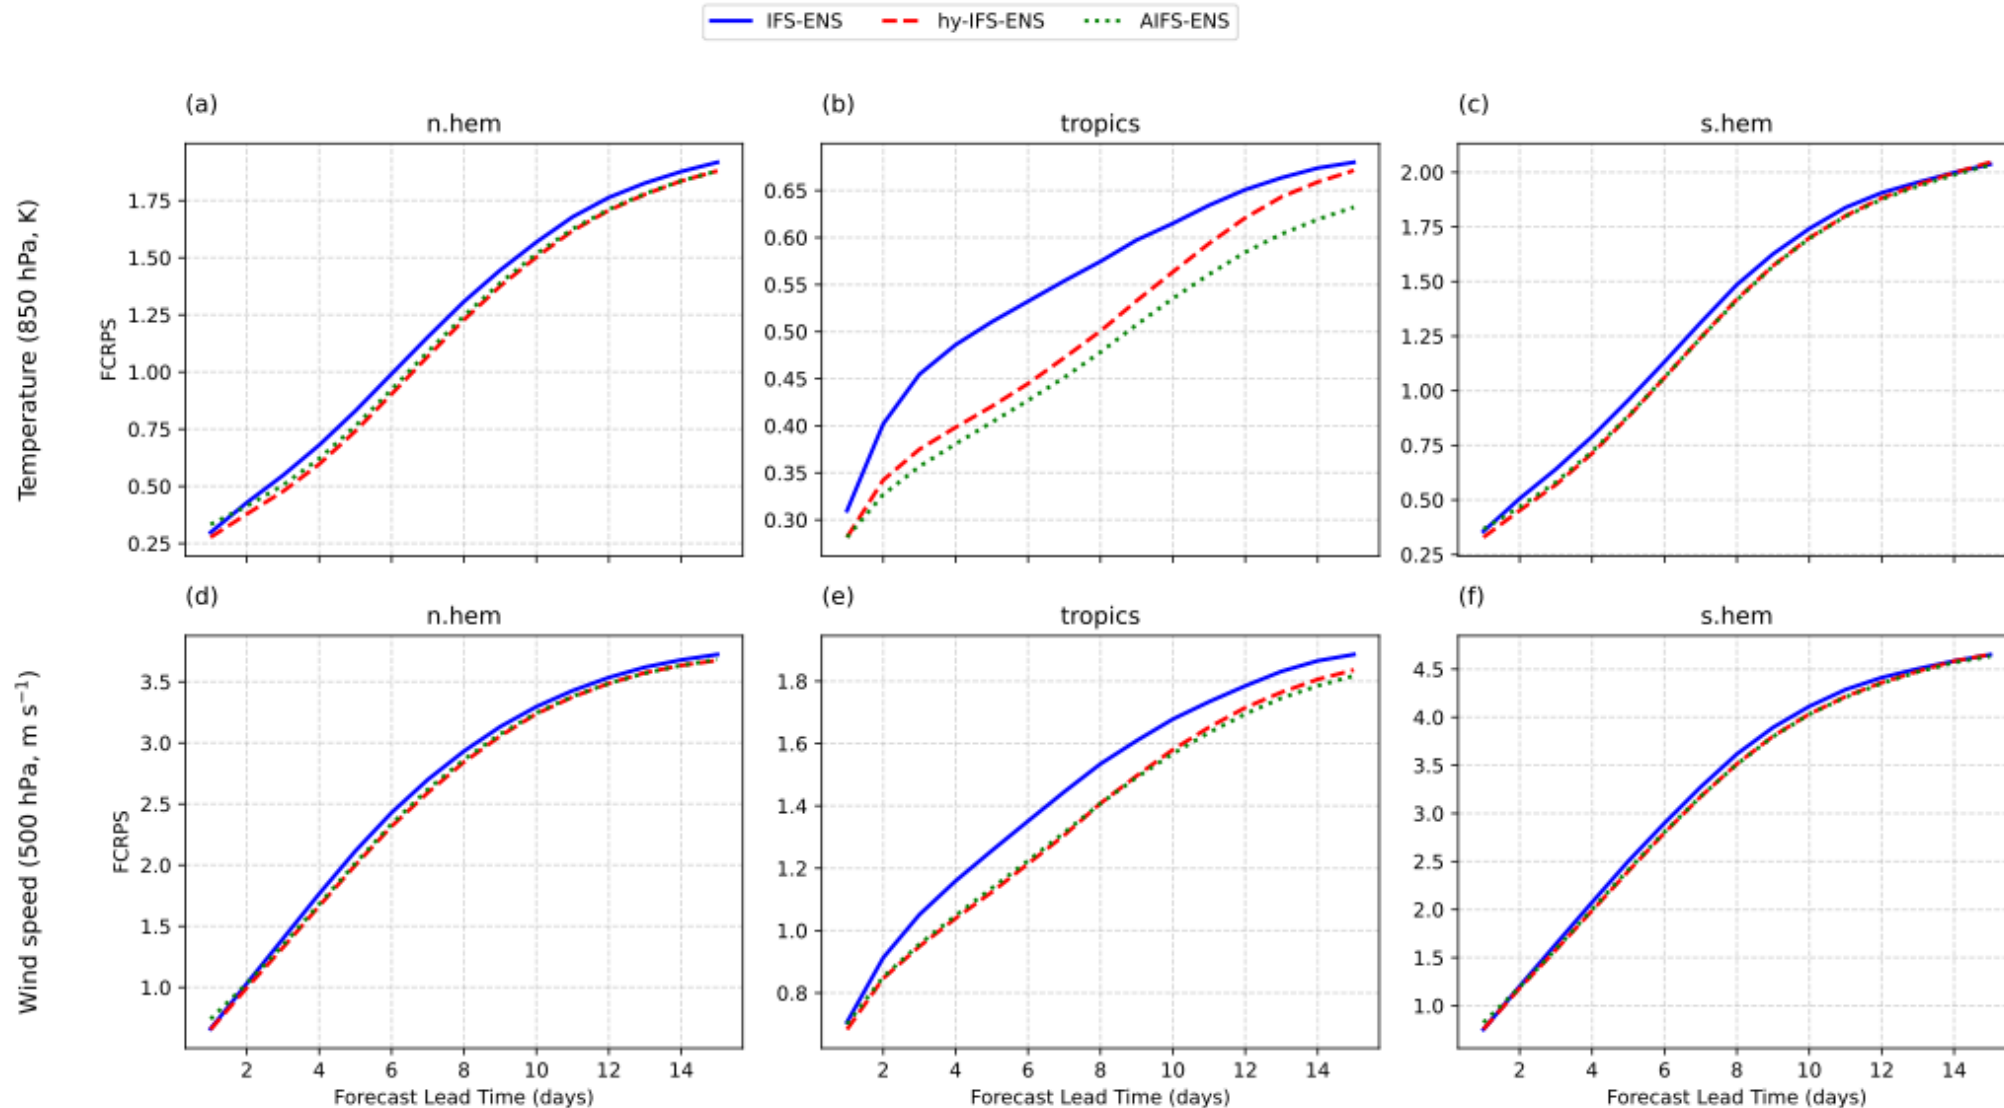

# Large-scale skill improvements: Control (=deterministic)

- Hybrid model also has about half the amount of forecast busts (when ACC drops below 40%) than IFS.
- Hybrid model has comparable number of FC busts to AIFS-Single.

# Large-scale skill improvements: Ensemble

- Upper air forecast skill translated from AIFS-ENS to hybrid ENS almost entirely.

# Large-scale skill improvements: Ensemble

- Surface variable forecast skill also improved significantly, even though surface variables not directly nudged.
- Hybrid has best forecasts for 10m winds and total precipitation, but AIFS-ENS still outperforms on 2m temperature.

# Tropical cyclones statistics at TCo1279 for 2024-2025: CF

- Tropical cyclone track errors improved up to 50 km by day-5.
- TC intensity and pressure wind-relationship similar to IFS and thus closer to observed.

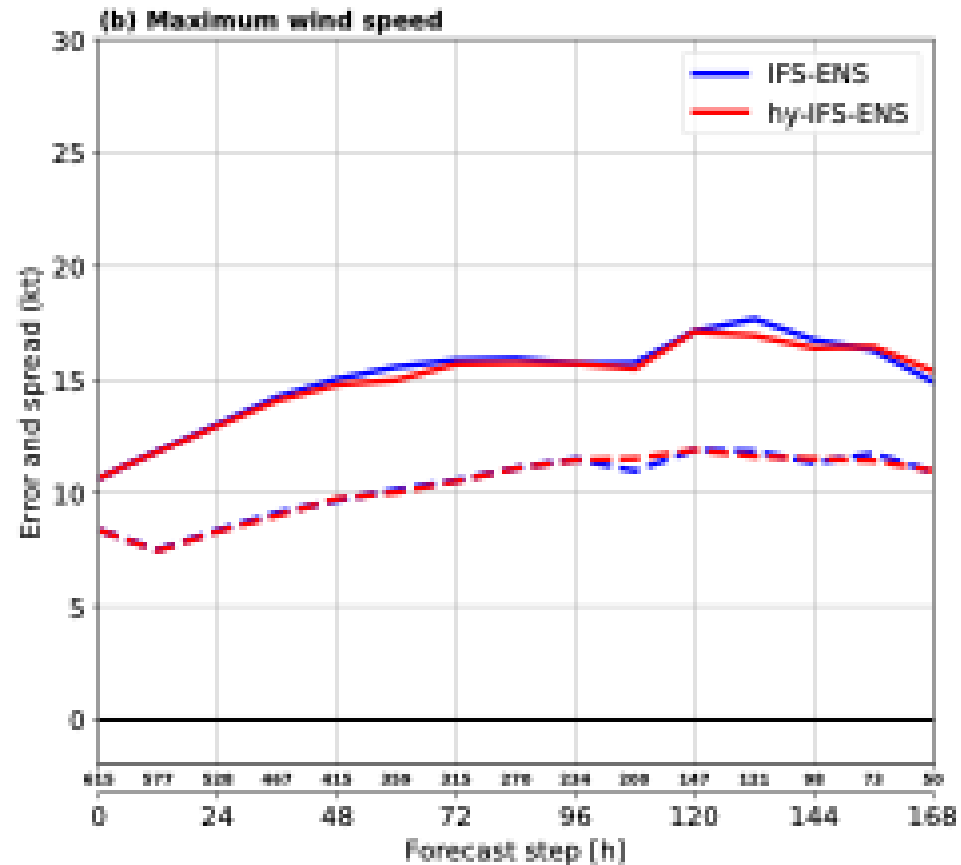

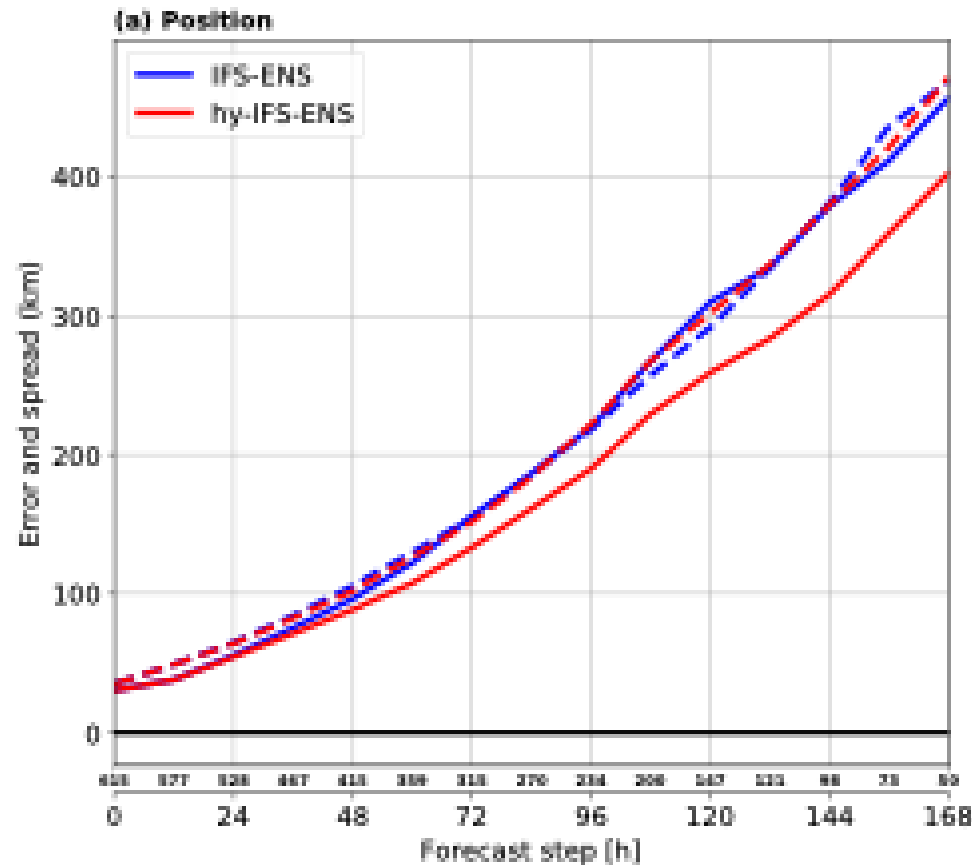

Figure courtesy: Michael Maier-Gerber

# Tropical cyclones statistics at TCo1279 for 2024-2025: ENS

- Tropical cyclone track errors improved up to 50 km by day-5.
- TC intensity (maximum wind and minimum pressure) same as in IFS-ENS

# Other extreme Northern Hemisphere events 2024-2025: CF

- Some indication of slightly improved temperature and wind extremes, and precip extremes in JJA in hilly and mountaneous areas.

# Other extreme Northern Hemisphere events 2024-2025: ENS

- Tails of 10m wind, 2m temperature and total precipitation are very similar in hybrid and IFS-ENS.
- AIFS-ENS suffers from insufficient resolution.

# Summary

- Hybrid system can conceptually be viewed as online bias correction, where IFS takes advantage of better large-scale flow representation of AIFS.
- Combining AIFS and IFS via spectral nudging for deterministic and ensemble forecasts improves:
  - Large-scale skill score metrics everywhere in the troposphere
  - Tropical cyclone tracks
  - Northern Hemisphere extreme event prediction
- The benefit of hybrid system over pure machine learned forecasts are
  - All forecast products are identical to those in IFS.
  - Resolution of physics-based model retained, including the small scales.
  - More physically consistent
- Hybrid system easy to integrate to operational workflow and can be applied at any resolution without having to re-tune.
